

BT in bid for lion's share of cable TV

by Philip Hunter
THE list of 37 consortia bidding to run the 12 pilot cable television projects on offer from the government shows that British Telecom intends to take a big slice of the cake.

BT is listed as a major shareholder for ten of the consortia, and its involvement does not end there. It has also bid for licences to lease cable systems to two of the other aspiring operators.

British Telecom is further involved with other major shareholders, such as Selec TV, which is a big sub-contractor to BT.

Another aspect is that BT is involved with competing consortia to operate cable TV in the Preston, Lancashire area, which is rather like placing an each way bet in a three-horse race.

Other well-known names are represented as shareholders of the consortia. Plessey is involved with Beamtrade bidding for the West-minster area. GEC is involved with three of the consortia. Ferranti, STC and Racal are also represented.

All the consortia have submitted bids simultaneously to the Home Office for provision of cable, and to the Department of Industry, for provision of the service.

Each of the 12 successful consortia will provide and operate the cable service in its area.

Announcement of the successful consortia is expected in November after EIU Informatics, selected to evaluate the applications, has made its recommendations. Priority will be given to consortia offering the most advanced services, including the possibility of two-way interactive communication, which is of particular interest to computer users.

Systems offering the possibility of using the next generation of cable technology, the star switch, will also be favoured, and offered an initial licence running for 20 years, as opposed to 12 years for consortia offering just tree and branch networks.

Consortia left out of the pilot scheme will be able to compete in other areas when the government sets up its Cable Authority. The White Paper for this was approved by Parliament at the end of the last session.

The 12 successful consortia will, however, have a head start on others and will be able to try out systems well in advance of satellite television coming in 1985 or 1986. It is only then that cable TV is likely to become profitable.

RUSSELL (Left) and KUROSE... "Careful when we establish partnerships."

Scan Data wins UK rights to Toshiba business micros

by John Riley

SUSSEX-BASED systems house Scan Data International has gained sole UK distribution rights to Toshiba's 8-bit and 16-bit business microcomputers, which had their UK premiere last week. At the same time, Scan announced that it has become sole UK distributor for Peachtree software for the Toshiba, Oxy and Texas PC microcomputers.

"We have been looking for a distributor in the UK for about a year," said Fumio Kurose, Toshiba Europe's president. "It is not enough to manufacture excellent hardware; it is necessary to make it a salable product with good software for total solutions. We also wanted a local presence offering special support."

"We are, therefore, careful when we establish partnerships. Toshiba is a very loyal partner and we look forward to successful co-operation."

Toshiba's UK distributor Office International will continue to distribute other products, but Scan now has sole distributorship of its micro products.

Scan Data, the first computer company to go public on the Unlisted Securities Market in 1980, will sell Toshiba's T100 and T300. The T100 is a Z80A based 64 Kbytes RAM and eight-colour display. It can be plugged into a TV set. Entry end user price for the machine is £1,495.

The T300 is an Intel 8088 16-bit machine, supporting MS/DOS and

CP/M 86 with graphics offering 256 colours, and a 10 Mbytes in-built hard disc. Entry price is £2,495.

Scan Data is to look for "reputable" computer dealers to sell the machines. "We are becoming increasingly aware that you do not necessarily need computer professionals to supply to the business micro market," said Scan's managing director Steve Russell. "So we aim to seek a balance." Russell expects to have 150 dealerships by June next year and hopes to sell 2,500 Toshiba machines in the next year.

Scan Data also sells the Texas Instruments personal computer, and is an OEM for Texas Instruments' microcomputers as well as Oxy microcomputers.

Newcomer shakes up the DEC distributors

by John Kavanagh
A NEWCOMER to Digital Equipment Corporation's authorised computer distributor scheme has attacked systems houses for enjoying favours from the multinational, but doing nothing to help the company, Minicom Commercial Software, has said that they must change their attitude to survive as DEC's more aggressive in their user markets.

"Some of the authorised distributors certainly need to sort themselves out and get into commercial markets," said Greg Conlin, sales and marketing manager at Minicomputer Commercial Software.

"Too many have been systems houses for a long time, they expect favours. They expect the company to give them leads, yet they're not adding value to the equipment themselves."

"They're naturally going to be worried about competition from DEC."

Conlin's firm covers defined markets. It has specific insurance broking systems, but is now moving into freight and plant hire systems.

"DEC has told us we are an authorised distributor," he said. "The message is, we are very strongly urged to go into vertical markets."

DEC targeted UK's business early this year and a Computing Services Association meeting they went to successful by going for general production and systems. DEC has signed in its catalogue of computer software, now being picked up by other DEC distributors.

But other official DEC distributors disagreed with Conlin and with DEC.

"He's absolutely wrong," Stephen Howe, head of Computer Services, "To be in DEC's catalogue is a great advantage. We have to be in vertical markets, but we also have to be in horizontal markets. We're good at both."

"If you rely solely on systems you could be in trouble because almost every user has some horizontal package in payroll."

Richard Coulson, director of CIA, agreed. And he was possible competition from its ledger system and horizontal products.

The authorised distributor scheme was introduced in 1981. Minicomputer Commercial Software is only the group to be admitted to the group, because DEC examined the great detail before admitting them. They get the same as DEC's 300 official equipment manufacturers to get extra benefits such as a product promotion.

ICL helps the taxmen with their searching

by John Kavanagh
ICL's CAPS content-addressable filestore could be set for take-off at last with plans by the Inland Revenue to install 24 systems across the country as part of the £150 million PAYE automation project.

The Inland Revenue application - identifying taxpayers from variable and doubtful information - has already grabbed the interest of the Department of Health and Social Security national automation project and ICL says many other government and commercial organisations need this facility.

The Inland Revenue is setting up 12 regional computing centres, each with between two and six ICL 2966 mainframes, between now and 1987. The first centre is going live in the West Midlands in January.

If this first CAPS project is successful, two systems will be installed at each centre, one for back-up. The 2966s will be linked to the CAPS using ICL's IPA network architecture.

And eventually a national searching facility will be set up, with all the regional 2966s linking to a central CAPS system as well as to their local system.

The entire CAPS contract is around £2.5 million - a small amount compared with the £60 million the Inland Revenue is spending on 47 2966s and 18,000 DRS terminal systems. But ICL sees this as a very prestigious reference site for this application.

CAPS is a very intelligent data system which can find information using only partly-complete search keys.

"In our manual system if we don't have a reference number we have to look up names and addresses in a card index or write to a taxpayer for more information," said Inland Revenue project manager Steve Matheson.

"We want to eliminate this paper chase but we can only do it if we can identify taxpayers solely from variable amounts of name and address information."

Matheson said CAPS was not available under the 2900 VME operating system when the 2966s were ordered in 1980. At that time the Inland Revenue thought it would have to put the manual system on the computers.

"It wasn't clear how we would meet the need for national tracing," he said. "But when CAPS came along most people were very impressed by it."

Just before the Inland Revenue news, ICL announced its latest CAPS order for commercial applications. The National Giro bank gave the company a £3 million contract for a CAPS system, a dual 2988 mainframe, an ME29 and a System 25.

Sinclair signs an assembly deal with the Chinese

by Philip Hunter
SINCLAIR Research, which sells home computers in the US and Japan, is on the doorstep of another potentially huge market - China.

The company has agreed to ship components for assembly by the Chinese into its ZX81 and Spectrum home computers. A factory for the assembly of home computers has been built in Canton, and Sinclair says that large quantities of computer components will be shipped if the initial venture is successful.

Sinclair has signed agreements with the South China Computer Company and the China Electronics Import and Export Corporation, following a recent visit to

China by Sinclair's managing director Nigel Searle.

Chinese engineers will visit the US soon for first-hand experience of Sinclair's assembly techniques. Sinclair's UK distributor Prism has won a contract to stage exhibitions in Peking to help UK makers of accessories for Sinclair machines push into the Chinese market.

The Sinclair deal is likely to be followed by many others between western companies and China. Already, factories in China make micros modelled on US and Japanese imports, and Commodore has some of its components made there.

China's aim is to build its own computer industry to serve its home market, and later perhaps to

export. Demand for consumer electronics products has rocketed in the last two years.

China fell far behind the rest of the world in technological development after the Cultural Revolution of 1966 to 1970, when many universities shut their science faculties. Now China wants to close the gap by persuading western companies to let her build their machines under licence.

The Chinese market looks especially ripe for the Japanese, because both written languages require a great many characters. Fujitsu has already sold mainframes to China, and Hitachi has produced a range of computers that can handle an input of up to 3,000 characters.

SEARLE... Will show Chinese how Sinclair does it.

Arbitrator says NCR must pay \$500,000

by Howard Katten

NCR of Dayton, Ohio, recently lost a dispute with a dissatisfied user and may have to pay nearly \$500,000 in fees and damages to the user, the Withrop Community Hospital in Massachusetts.

The decision against NCR was made by a judge from the American Arbitration Association, who ruled that NCR had misrepresented the capabilities of a system it sold the hospital seven years ago. The hospital had claimed that the software was never fully operational.

The award was, however, substantially less than the \$3 million the hospital had originally sought.

NCR is declining to comment until the judge's decision to the hospital is upheld by the US district court where the hospital's suit originated.

NCR has lost several cases in the past year.

In the latter half of the 1970s US computer users became more assertive and litigious and began suing computer vendors with increasing frequency.

Many of these cases have been coming to court in the past two years.

3-D Solid Modelling at a 2-D Price

Now PAFEC offers you true three-dimensional solid modelling systems at a price most 2-D systems can't match.

PAFEC's Apollo-based system gives users a powerful virtual memory, 32-bit computer at a previously unheard of price.

Software is PAFEC's comprehensive DOGS program which includes parametric symbols, properties, database and archive, for drawing management. NOW AVAILABLE WITH A THREE-DIMENSIONAL DESIGN SYSTEM called BOXER - and yet still under £50,000 complete!

BOXER 3-D SYSTEM OFFERS:

- Creation of three-dimensional models from solid geometric primitives.
- Manipulation of primitives to create complex models and assemblies.
- Parametric design allows easy production of a range of different designs.
- Creation of arbitrary views for labelling and dimensioning.
- Volume and inertia calculations.
- Hidden lines removed or shown dashed.
- Perspective and orthogonal views.
- Fast and accurate computation.
- For full information please telephone, write or complete the reader enquiry card.

CAD made affordable

Some jobcentres are to be equipped with microcomputers.

Micros aid jobless

by Caroline Burgess
TWENTY-SIX Employment Division offices will soon receive microcomputers thanks to ideas from their own staff. The MCS called for suggestions from its own staff for projects to improve efficiency by using microcomputers, in a year-long experiment.

A total of 120 offices submitted ideas mainly covering the administration of schemes, accounting, monitoring of community projects and recruitment through jobcentres. Twenty-six projects were then selected to be put into practice.

The successful offices will take delivery of their microcomputers within the next few months and staff will be given special training. The money for the equipment will come out of the Employment Division budget; £120,000 has been allocated for the scheme.

Chief executive of the Employment Division, Bryan Emmett,

said that by tapping the imagination and enterprise of staff a number of interesting ways had been identified where technology could be applied to local services and operations.

Aberdeen and Newbury jobcentres were among the offices chosen. Their projects aim to overcome the problems of engaging staff to work for North Sea oil employers, and an effort to identify skill shortages.

The MSC Regional Office in Wales will compile records of its staff's experience and training to help internal recruitment and highlight training needs.

All the projects will be assessed throughout the experiment, with the possibility that they may be extended to other offices.

This experiment is in addition to the effort being made by the Employment Division to link all jobcentres to a national computerised job vacancy system.

West German videotex service is launched - to be replaced in 1984

by Donald Kennett

THE West German Bildschirmtext videotex service had its public launch at last week's Berlin Radio Show as planned - but based on an interim system that is to be replaced next May.

The full public service is to be implemented by IBM under a contract it won at the end of 1981. The trial service, which has been running since 1978, is based on GEC computers running software adapted from Prestel by Systems Designers.

To prevent the embryonic German videotex market from being frustrated by the problems IBM is having in implementing its system, the Bundespost has put more than £500,000 into extending the trial system.

It was adapted to hold a duplicate database in the enhanced display format that is a key element of the full service alongside the Prestel format database.

The money has gone on software and hardware from SDL and GEC.

The enhanced format uses a standard developed by CEPT, the Conference of European Postal and Telecommunications authorities. In 1981, Bildschirmtext chief Eric Danke said that the Bundespost had planned to use an enhanced display format from the beginning of 1978 and for that reason the number of Prestel-type terminals allowed into the field had been limited to 8,000.

SDL marketing manager Ian Taylor said his company had earned more than £250,000 from the Bundespost this year, and he hoped there would be more support work for it to do during the transition period.

In 1978 the Bundespost was praised for its foresight in implementing gateways to external computers and the UK's Prestel system bought the right to copy that feature. In 1981 it was praised for its determination to get the best of both the UK and its rival French system in its display format.

Now, as its Austrian neighbour looks set to leap ahead with a Prestel-compatible system ordered from GEC only last April, Germany's user frustration is mounting.

Austria is spending a total of £5 million from which its expects to provide a phased introduction of service from the end of this year. GEC won its contract against bids from IBM, IIT and a consortium of French companies.

GEC has also won a £2.7 million contract to implement a public videotex service in Malaysia on a 44-week schedule from last April.

Intel delivers a threat to OEMs

by John Riley
OEMs are at the crossroads, warned Intel last week after the chipmaker pushed deeper into the systems market and moved closer to the commercial market.

The occasion was the launch of its second wave of microprocessor systems, which it claims to be the first to be built around its iAPX 286 chip.

The systems, called the 286/380 and the 286/310, are for OEMs, and combine the iAPX 286 microprocessor with 80287 coprocessor, with an enhanced Multibus architecture and systems software. Both systems offer Xenix for the commercial market or iRMX 286R, Intel's real time operating system for the technical market.

"The new products affirm our basic strategy to continue to lever silicon technology into new integrated systems," said Bob Kelly, marketing manager of Intel Corporation's System Groups.

"OEMs now have to choose whether to continue with minicomputers or go to micro-based systems. With the iAPX 286 base and the Xenix operating system we are in a position to take over traditional minicomputer applications such as multi-user and

multi-tasking activities," he added.

By developing systems around its chips and boards, Intel does not consider that it is competing with OEMs. "OEM requirements are changing," said Kelly. "A lack of skilled engineers and programmers is pushing OEMs towards standard board, system and software products, and in any case by buying at higher levels, OEMs don't need to invest from the bottom up at chip or board level, and can invest their resources in applications that they are good at."

The 286/310 integrated system has 512 Kbytes error correcting RAM, four external slots and a 10 Mbytes Winchester, costs around £7,500 and will be available from December. The more powerful 286/380 which has 512 error correcting RAM, 35 Mbytes Winchester and 11 slots will be available this November and will cost between £22,000 and £23,000.

"It took us four years from the launch of the 8086 chip to produce the 86/330 integrated system, and we produced the 86/05 board in between," said Kelly. "But we launched the iAPX 286 chip and the 280/10 board almost together, and now only nine months later we

have launched the 286/310 and 286/380."

Intel also launched a family of three 8086 based integrated systems: the entry level system, the 86/310-1, has six slots, 128 Kbytes RAM and costs under £4,000. The other two, the 310-2 and 310-3 are based on combined 8086 and 8087 chips, and offer respectively 256 Kbytes and 640 Kbytes RAM.

"The whole orientation of the upper level of microcomputers is changing," said Kelly. "With the 286 chip we now have the functional capability of a super micro and can perform traditional minicomputer applications. By that I mean the 16-bit super micros can offer multi-user operating systems with standard interfaces, 16 Mbytes addressing, memory protection, multiprocessor bus architectures and high-speed numeric processors."

Intel is developing a 32-bit chip, the iAPX 386, which is expected to have a long term future. "It took 30 years to get mainframes to evolve to 32-bits and that's where the technology stopped, except for special purpose and scientifically oriented machines," said Kelly.

"However, most commercial ap-

KELLY... "New products affirm basic strategy."

plications can be served by 32-bit machines, so I think 32-bit microprocessors will have the same type of life span as 32-bit mainframe processors have had."

At present Intel is working closely with a large number of companies developing the Multibus 2, looking at the 32-bit bus structure for the long term.

The spec for Multibus 2 will be out towards the end of this year, said Kelly.

"The move into 32-bits is a long term thing and we want to get the structure right first and work out how efficiently it does tasks before we sort out what applications it will serve," he said. "There are so many people involved."

SALES BRIEF

Plessey wins £4 million export order

PLESSEY Office Systems has secured a contract worth £4 million over two years to supply 100 PABX systems in the Middle East to British Telecom's Arab Emirates telephone authority. Deliveries will be later this year and are expected to be in the region of 200 to 300 switches per year. Competition for the contract came from the UK, Japan and France. Plessey has launched the CDSS 1000, a 100 line multi-million pound contract CDSS equipment from Taseco, a Finnish electronics group.

Vector's biggest

VECTOR International signed two contracts this month. One, the biggest ever, valued at £2 million came from GTE AT&T, upgrade existing equipment. The second, worth \$200,000, was a new order from Nafra NV 6 minkey systems to automate loading on to tankers.

Timber order

NINDORE Computer has secured an order for its 8800 computer system from Inter-Com, a computer and broker of timber, order includes six VDU and printers and will be used in Inter-Com's London and Liverpool offices. Inter-Com also sells timber accounting software.

APL travels

MIRAGAP, the UK's microcomputers training and programming language, shipped its first London machine across the water to a computer, a Motorola 68000 machine with 12 Mbytes disk space, will be used in the region of Yamato in the Pacific for agricultural statistics.

China orders

A DUBIN micro machine has won two contracts in China. Data Controls, which manufactures monitoring and control systems, has been awarded one contract worth £200,000 for Hong Kong. Another estimated at £50,000, mainland China. The company will control water supply. The company has already won contracts for the Irish State Railway Board and the electrification of the railway in Dublin.

Gould sale

AGOLIN 3227 system with CAD workstations and software for vehicle design has been ordered by ECS Group, Walter Alexander and Co. Coachbuilders. An additional workstation for parts and control will also be supplied.

Prosyst purchase

A DEC VAX 11/750 with 8 Mbytes of main memory and several Apollo DN360 workstations have been installed at Prosyst Technology, a new Cambridge based CAD company. The VAX 11/750 will be used for engineering simulations while the Apollo will aid the development of CAD software products.

KL's Set buy

SRT Systems has placed another £750,000 order from KL for its System Selection Terminal. Taking the total order value from KL to £1,750,000 this year.

Telemetrix order

TELEMETRIX has moved to the North American market and orders worth £500,000 and the opening of its first sales and service subsidiary in the US.

BAXTER... "Not withdrawing from the hard disc unit market."

Commodore gives Tandon a breather

by Caroline Burgess
COMMODORE is making a break from the hard disc market, while it gives Tandon a chance to improve its drives. Many complaints regarding the reliability of Tandon disc units have prompted Commodore to stop supplying its own label products for the moment.

"We are not withdrawing from the hard disc unit market," said John Baxter, Commodore UK marketing manager. "We are not selling them at the moment because they are not good enough and if they need to be repaired they have to go back to the US."

"Tandon is not capable of producing a reliable hard disc unit or present. We are advising our

dealers to go elsewhere if their need is urgent."

This is good news for some. One recommended supplier, Mator, claims that it has been inundated with orders from Commodore dealers.

Mator reckons its orders have doubled, and instead of customers ordering one or two some are ordering 10 or 12. It is the 10 Mbyte unit that is selling best.

"No one seems to know what Commodore is doing," said Michelle Knight, Mator's sales manager. "But we are able to meet the demand."

For the last six months people have been replacing Commodore with Mator.

Crystal is far from clear

by Keith Holder
ASTON Technology's Crystal 68000 microcomputer has run into stiff opposition - because of its name. There is another Crystal, or more correctly a group of companies, based in Torquay, which have been marketing a range of products, including hardware and software under this name, for over 20 years.

Crystal Research, one of the group, has put the matter in the hands of its solicitor with a view to prohibiting any use of the words Crystal products by Aston Technology. "It has caused us a great deal of embarrassment," said Trevor Brown, Crystal Research managing director.

The whole situation arises over a legal grey area. A word such as crystal cannot be registered as a trade name, as it is descriptive.

Belgium puts £6m in office

by Jack Gee
THE Belgian government has announced that it will spend 500 million francs (£6 million) on office automation this year and double this annually from 1984 to 1986.

Announcing the new move, the government's Ministerial Committee for Economic and Social Coordination said: "Our objective is to enable Belgium to set up an industry with the capability to manufacture complete office automation systems which involve a maximum number of components, products and sub-systems with high added value and of Belgian origin."

The government was also concerned about guaranteeing its own sources of supply from Belgian industry because the Civil Service was a big customer for these systems.

Dalkeith shuts as ICL puts Perq in Kidsgrove

by John Kavanagh
ICL is moving all development work on its Perq scientific workstation to one centre in Kidsgrove, Staffordshire, and closing its Dalkeith software operation near Edinburgh. All 80 technical staff will be offered jobs in Kidsgrove but eight administrative jobs will be lost.

Meanwhile a new version of the Perq is imminent.

ICL says the Kidsgrove move is proof of its commitment to a product which it admits has not sold as well as expected in the first two years. In addition the Cadcentre - now partly owned by ICL - is planning to use the rival Apollo Domain for its push into the US.

About 500 Perqs have been sold by ICL at £18,000 each, yet the company has over 130 staff working on the product. And that 500 includes 100 for internal ICL use in applications ranging from hardware design to software development and producing graphics

for presentations.

Another 200-plus have been taken by universities, polytechnics and the Science and Engineering Research Council, leaving between 150 and 200 in commercial and industrial companies.

US firm Three Rivers, which developed the Perq, has sold another 500. Three Rivers covers North and South America and Japan while ICL has the rest of the world. Apollo has also sold just over 1,000 of its Domain machines.

ICL Perq marketing manager Reg Chamberlain said sales would double to "a couple of thousand" next year and take off in 1985. Managing director Robb Wilton was "absolutely committed" to the product and the company was investing more in it than ever before, he said.

Chamberlain said the take-off had been slow because it was difficult for users to appreciate the benefits of the Perq.

"Everyone is extremely impressed by the graphics and power but it's hard for an engineer who is used to a shared batch service or a dumb terminal to realise what a single-user workstation means," he said.

The Perq has also been hit by software problems. ICL has come under fire from university users for delays with its Unix operating system, PNX. There have been cases of Perqs gathering dust while users waited for PNX because they saw no point developing software for the Perq's original POS system when an industry standard system was coming.

ICL and the Science and Engineering Research Council were working on separate versions of PNX until last summer, when ICL killed the SERC project and worked full tilt to produce its own product.

Chamberlain said the first release of PNX had been available for some months and ICL was

about to publish a catalogue of applications software.

There were over 40 software developers with products ready or on the way, he said, especially in computer-aided design and manufacturing, engineering and document production.

Chamberlain said the Perq price had not restricted sales. "The alternative is a shared minicomputer. The constraint is the lack of appreciation of what a Perq can mean to users."

The Perq 2 was announced in the US by Three Rivers early this year. Its UK launch is "very imminent". The new version offers more memory and disc storage rather than radical processor differences.

White-collar union ASTMS is consulting the Dalkeith staff this week over the Kidsgrove move. "We're not formally doing anything yet," the union said. "But eight admin staff have not been offered relocation."

Acorn spends \$3 million on US ads

by George Block
THE BBC micro maker Acorn of Cambridge is limbering up for the launch of its successful machine in the US with a \$3 million nationwide advertising campaign.

It faces very stiff competition in American schools from Apple, Tandy, Commodore and Atari, among others, which have adopted a loss leader approach in outstriking the educational market.

"They're virtually giving them away," commented Acorn UK marketing manager Tom Hohen-

berg. "We won't be copying that technique, because we believe we've got a better package. They tend to just give hardware, whereas we'll be supported by over 200 software packages."

The software has been Americanised and the voice of Kenneth Kendall dropped in favour of an American one.

Last week promotion began in earnest with advertisements in the *Wall Street Journal*, *New York Times* and a number of educational newspapers and magazines.

US sales chief Harvey Lawner said he had advance orders worth \$8 million even before they began shipment in November. There are no plans to introduce the new, lower-priced model the Electron across the Atlantic.

Lawner's team of 30 is likely to be boosted by 10 or 20 before shipments begin.

Hohenberg said the American manufacturers had seemed hell-bent on giving machines away, having overestimated the size of the market.

Wales wants an unfair share

by John Riley
THE Welsh Development Agency last week geared up its campaign to promote Wales as "technology friendly" by opening a London base for 120 Welsh high-tech companies.

The companies will be able to use the London base, which is situated at the National Electronics Centre near Tower Bridge, for demonstrations, displays and meetings.

The agency is to set up two 60,000 sq ft complexes in Wales

next year, at Newport and in North Wales custom designed for high technology industries. One company, Newtech, which develops software for the IBM microcomputers, has already booked 20,000 sq ft of space in the northern Deeside Park.

"We want an unfair share of the new technology industry," said John Williams, chairman of the Welsh Development Agency. "We are nearer to London and Heathrow than Scotland, offer substantial incentives, and have got our act together."

Local authorities go west for their software help

by Caroline Burgess
BROKEN promises, inadequate packages, late deliveries and poor back-up services from commercial software houses have led many local authorities to turn to West Wiltshire District Council for help.

The council is now selling its own software systems. All are developed in-house by local authority staff. "Great emphasis has been placed on developing comprehensive user friendly systems and we now have a range both financial and non-financial, which serves the needs of discriminating professional officers," said Roger White, the council's group finance officer.

The move to market the systems came about a year ago as a response to enquiries from other local authorities. "It quickly became clear that there were many authorities wanting to use systems which had been developed by local gov-

ernment professionals and had been proved where it matters - in the offices of those who rely on them to do their job," said White.

Bracknell District Council is one local authority that turned to West Wiltshire. "We were caught on the hop by the housing benefit legislation and let down by one commercial software house. West Wiltshire came to the rescue very quickly," said Pat Dober, Bracknell's deputy housing manager.

"We have no resources for developing our own systems. We are dependent on buying and really get no help from computer companies, even though ICL is situated very close by."

West Wiltshire's first customer was West Somerset, whose computer manager, Alan English, said: "Any software package is a compromise. West Wiltshire's was as close as we could get to our needs. Its systems are also much cheaper."

We use one system from a commercial firm but the back-up is not very good.

"The housing benefits scheme was very complicated but using their system we had the problem sorted out on time," he added.

West Somerset claims to have saved £30,000 in the first year since using a computer for rate collection. The money saved has been used to expand the computer system.

"Local government people understand local government needs - we speak the same language," said White. "We have the knowledge of the legislation, a lot of which is open to interpretation, so we know what is needed."

"We organise demonstrations to suit who is coming. We get a local council officer to explain how it works as one professional to another and show the advantages."

West Wiltshire District Council was at one time used as a demonstration site by ICL. It also took part in last year's ICL road show which, according to White, helped to spark interest in their packages.

As West Wiltshire has been an ICL user since 1975 products are aimed mainly at other ICL users. It now has 50 online terminals for its 170 staff from its ICL 2955, which allows the council to deal with new legislation without increasing its workforce.

"Every £1,000 spent on a West

Wiltshire system saves the purchasing authority at least £3,000 in its own development costs," claims White. "The money saved can be used to keep rates down or on other services."

The money received for the sale of West Wiltshire's systems goes into its general rate fund. At the moment it is saving about 1p in the pound on rate demands. About 200 systems have been sold to 20 local authorities.

Software packages available include, rates, rents, direct debit, housing benefits and estimates. One future development soon to be available is an environmental health solution to deal with such things as improvement grants.

Broken promises have caused many town halls to turn to Wiltshire.

Working late again?

When NEC-computer-makers to the world-made their own computer; naturally, by cutting out the middleman, they made their own computer more competitive in price. And performance.

Take the new NEC 16-bit Advanced Personal Computer (APC), for example: it can store more information and operate faster and easier than any system in its price range.

The APC and its NEC 3530 Spinwriter has so many unique features-in fact, there are too many to list here.

But on the corner of this page, a small snip could mean a giant leap for your business.

And a little more time for your family.

Cut out the middle man. Go straight to the top.

French are the tops for service

by George Black

THE French dominate the services scene with 10 of the Continent's top 20 companies, says the 1983 survey by the European Computing Services Association.

"Apart from the appearance of Thorn EMI there has been little radical change in the relative revenue positioning of major European companies," the report says. BP's subsidiary, Scicon, at number two after IBM, is the only other British company to figure in the top 20.

The French strength is attributable to third placed Societe Generale's SG2 group, which has 4,290 employees — more than any other organisation listed; the government's CISI, placed fourth; Cap Gemini-Sogefi, second largest with 4,000 staff, which came fifth;

GSI, eighth; and Sema Metra, which came tenth.

IBM managed to generate \$180 million from its remote and batch computing services division, which was the corporation's only division considered in the survey. Scicon, whose activities included in the survey software products and services, was a close runner-up with \$175.4 million. It moved into the second place, despite having fewer employees at 3,500 than two of its main French rivals.

Thorn EMI's appearance in the survey is due to its takeover of two thriving properties, formerly belonging to British Oxygen, bureau Datasave and systems house Software Sciences. The group came 25th — one place after Logica.

Along with IBM, Americans continued to take a large slice of

the market. General Electric's systems house, Geisco, ranked sixth, netting \$150 million from some 1,200 employees.

Control Data was the only other big American mainframe maker to be listed, at position 12. ICL's consultancy and training section appeared only at number 20, because only the firm's software products and services operations were taken into account.

Best performing German outfit was the tax advisers' co-operative, Datav, which came ninth. The Italian Finel, part-owned by the Banca d'Italia, was seventh. And several smaller European countries showed evidence of up-and-coming concerns, such as Sweden's Datasma, part of the Johnson group; the Belgian CIG; and the Danish Kommadata.

Langton aims for third spot

by Donald Kengett

LANGTON Information Systems aims to be number three supplier of private videotex systems next year with a package it has developed which runs as a CICS application program on IBM mainframes. The current top three suppliers are ICL, Rediffusion Computers and Aegion.

Langton's videotex products manager Barry Ashdown said: "We believe that the next generation of videotex products will be integrated with mainframe data processing and that PIII is the first of perhaps many integrated products."

Langton was one of the first companies to develop a videotex product when in 1978 it launched its Preview package, which converts IBM databases into videotex format. It is also part of the AGB Research group which runs a videotex bureau service from its computer centre in London.

PIII is claimed to allow virtually all users of IBM and plug compatible mainframes to get a trial videotex system running very cheaply, with the videotex terminals able to access existing mainframe databases and interact with mainframe application programs.

A four-port trial system costing £25,000 can easily be expanded at a cost of £400 a port to handle up to 200 ports, according to Ashdown. This compares with a cost of more than £100,000 for de-

veloping a system in-house.

Alternative IBM communications arrangements would also cost considerably more, Ashdown said. PIII uses a specially adapted version of the Videotape videotex terminal concentrator originally developed for Thomson Holidays' network by Micro Scope.

This handles up to 31 videotex

terminals, performing validation on data collection operations, providing frame editing facilities and compiling access statistics.

The system is also capable of supporting terminals using the new CEPT European standard for videotex, which incorporates facilities for enhanced graphics.

ASHDOWN... Believes in mainframe integration.

Venture forces a sharp rise in sales.

US shipments set to top \$100 billion

by George Black

US computer shipments will be nudging the \$100 billion mark next year, predicts the Massachusetts market analyst Venture Development Corporation.

Venture foresees a sharp rise in sales from only \$51 billion in 1980 to around \$92.4 billion in 1984.

In its latest report it calculates the industry's growth rate over the first half of the decade as 15.9%; and it expects 1984 to be better than 1983, with the rate of growth increasing from 14.1% to 15.4%.

Software and services are taking a bigger slice of the cake, not surprisingly. Mainframe sales are slowing down and may only grow 2.7% this year. Even minis are likely to boost revenue only by 15.6%.

Against this the personal computer market is going through a boom phase and should net an extra 35.9% this year. Mainframes will probably lose a further 13% of the market over the coming four years.

The annual income derived from software and services is predicted to grow at 20.6%, from

\$5.5 billion in 1980 to \$11.7 billion in 1984. Applications programs are doing particularly well, pushing up their share of the business probably to 27% next year.

Supermini sales topped \$1.6 billion in 1982, which was up 36.7% on the previous year, according to another new Venture document. The inquiry attempts to nail down the term "supermini" which it notes has become vague.

Venture defines it as having a CPU with an internal word length of 24, 32 or 48 bits, maximum main memory of one megabyte or more, logical address space of one megabyte or more, and using a bus structure, not a typical mainframe point-to-point structure.

Computational superminis took more than 40% of the market in 1981, but by 1986 general purpose business systems will have edged them out, it says. Their sales will "seem to explode", rising to 36.1% of the market. Real time, computational and timesharing systems can also expect to prosper.

The US Computer Industry Association's Supermini Computer Industry 1983-1986, A Strategic Analysis, both from VDC, 1 Washington St, Wellesley, Mass 02158.

Vermont drums up memories

by John Kavanagh

DRAM memories, like puffed curds, might be on the way out, but there are still some good orders to be won. This is clear from a £160,000 contract for Vermont Research to supply drums to Plessey Control for its telex exchanges.

"The market is declining, but we're increasing our market share," said US sales manager Paul Callus. "Drums are still used where fast access and high reliability are needed. The biggest application is telecommunications; for example in telex and telephone exchanges. Bell Telephone uses our drums worldwide."

"Drums are more expensive than discs, but we have an access time of seven milliseconds, compared with 50 to 70 on a Winchester disc. And some of our drums have been in 10 years and never needed a service call."

Vermont is staying faithful to drums: it recently announced its biggest device, with 9.6 Mbytes of capacity. But it is also moving into the disc business. Last year it launched an eight-inch drive with 10 Mbytes of fixed and 10 Mbytes of removable disc.

The progress of this product has pushed up the value of Vermont shares on Wall Street in the last six months. Vermont is a \$15 million firm with operations in the US and the UK.

BICC disappoints

CABLES group BICC has had a disappointing performance in the first half year, with profits down 60% to £33 million. But financial analysts expect strong recovery in the second half of the year as the company enjoys the final benefits of 35% staff cuts over the last four years, and its final year profit is expected to be about £85 million, compared with £19 million last year.

Infomatics buy

INFOMATICS, one of the largest US software houses, has taken over Creative Data Systems (CDS), the Ohio-based supplier of retail and distribution packages. CDS has installed 80 Wang-based systems, and its products will now be sold by Infomatics Distribution and Retail Systems Division alongside existing packages for wholesalers.

Datasouth dollars

US PRINTER maker Datasouth has raised \$16 million by going public on the New York stock exchange, to help develop a new high quality printer. The company, which has its products distributed in the UK by Datasouth of Northampton, has been more successful than some rivals at coping off Japanese competition, and has sold 28,000 of its DS 180 matrix printers.

Brown Boveri up

THE Brown Boveri Kent Group of instrumentation and process control specialist companies has doubled its pre-tax profit to £1.3 million to £2.7 million on its most unchanged turnover of £5.8 million for the half year ending June 26. The group credits a restructuring for the gain.

Northern Telecom, the great all-rounder in DDP and communications

Distributed Data Processing is our business; communications our strong-point.

When you choose a Northern Telecom DDP system you're also getting a telex, terminal, wordprocessor, mail-box — you name it. And you're getting closer to the automated office.

Compatibility is our watchword — from hardware, software and communications, to the way you use them. Our versatile range of systems allows you to build and develop a network to suit your needs and run your business more smoothly and efficiently.

The common operating systems gives you free movement of resources around the network. Thanks to our computer expertise and telecommunications know-how, you can communicate both inside and outside your organisation — without leaving your desk.

Northern Telecom is one of the world leaders in this field, with vast resources. We design and manufacture our equipment, and back it with software and support services close at hand throughout Europe. You can depend on our commitment to your growth.

So if you want a professional DDP system, and you feel the urge to communicate, start talking to us:

Northern Telecom Data Systems Ltd, Arden Grove, Harpenden, Herts AL5 4UD. Tel: (05827) 63161. Telex: 825334.

MICRO PRICES

Will Christmas bring gifts for micro makers?

Kevin Cahill looks ahead to the end of this year

THIRTY dollars by Christmas is the uncomfortable forecast being made by American dealers for the Commodore VIC 20. This is exactly half the generally agreed manufacturing cost of the device, and a third of the lowest known price at which Commodore is willing to wholesale the machine to dealers.

How, then, can this forecast be met? Easily, according to the following line of reasoning.

First of all, the marketplace itself is hanging. Secondly changes are being imposed on it by Commodore's aggressive boss, Jack Tramiel, and thirdly, further deep changes are being wrought both in the market and in people's perceptions by an eclectic titled Englishman, one Sir Clive Sinclair.

Maybe it was Sir Clive's elevation to the peerage early this year that inspired a thoroughly old-fashioned English stockbroker,

with a degree of prescience unmatched by the slow public school drawl of its proprietors, to write to its clients and tell them that there were only two micro makers fit to stay in the business.

They were Sinclair Research and Commodore International.

In conversation with one of the partners in the firm, who refused to be identified, Commodore was picked out for the unoriginal reason that it knew how to "make it cheap and pile it high".

And, of course, Commodore is a fully quoted company and therefore suitable for investment, which Sinclair Research isn't as yet.

Besides, the same gentleman, in his lightly blue striped tie (Bton), said that he didn't really know yet what Sinclair Research did.

From an investment point of view, Commodore shares have travelled a smart uphill route since last year. Unlike several other paper fortunes made in the American stock markets recently, which have tended to dissolve as fast as they materialised, Commodore has made its blue chip price stick with its brilliant results.

But there is a fair chance that while the Old English's advice may have worked, it may have been for the wrong reasons. When it really comes to "building 'em cheap and floggin' 'em fast", no one can do it better than Sir Clive.

He has, single-handedly, made the UK the world's most computer literate nation.

He has done it, some commentators assert, not because he is the electronics whizzkid suggested by the national newspapers, but because he can read a component list faster than anyone else in the market, spot the trends, and build a device fast enough to catch the same trends.

Tramiel, while marching in part to the same Asiatic mice drum, is also marching to another tune, of a slightly more sophisticated composition.

At the Hannover fair this year Tramiel told *Computer Weekly* that there was a market out there for 50 million micros.

"Only 10 million of those will be business computers."

"Twenty-five million will be home computers and 15 million will be personal computers," he said.

By 1986, the year in which Tramiel suggests the market will be taking his forecast number of machines, there is every chance that the price of a home micro will be the same as the price of a pocket calculator now - around \$20.

Tramiel himself often mentions the business he did almost as much to create as Sir Clive, that of pocket calculators.

Will Santa Claus have goodies lined up for the micro manufacturers?

"In 1968 we sold pocket calculators for \$1,495. Eight years later we were selling the same calculator for \$9.95."

It is almost as if Tramiel is trying to ignore the very market he is doing so much to create and shape.

The ZX81, or Timex 1000 as it is known in the US, is already selling for less than \$30, and there is talk of the Spectrum Timex 2000 coming down to under \$50 by Christmas.

If the forecast which opened this article is met, then Tramiel will have forced a very interesting price fall on Sinclair. The estimated cost of manufacturing the ZX81 has been put at \$7-\$14, and of the Spectrum at \$23-\$28.

At \$50 this would still leave a margin for Sinclair and Timex, but not if those two machines have to follow the VIC 20 down below the 30 mark.

With Tramiel talking about a home machine costing \$100 by 1986, and his own current home machine heading rapidly for a third of that price, someone has to be wrong.

In practice, no one is wrong, and Tramiel may well have exposed a major flaw in Sinclair's strategy.

American dealers are already selling VIC 20s at a loss, or even going around to their local Safeways to buy them for at least a no loss "sell on".

The reason most of them give is that they hope to make up the profits on the sale of software.

In this respect they may be betting on a good wicket. A forecast for the toy industry made about two months ago shows that there is a growing trend for people to buy games cassettes for their home computers, rather than for the specially constructed machines made by games companies like Atari and Intell.

The reason for this trend is simple. Games cassettes for the small micros tend to cost about \$5 to \$7, rather than the £10-£15 it costs to buy games machines for specific games machines.

Dealer optimism is further buttressed by statements from executives at Commodore, who are forecasting that 50% of the company's future revenues will one day come from software.

But are the independent dealers being fooled? More and more, Commodore in the US is selling its machines through big chain stores like Sears and Safeways.

This is making the home computer user into an impulse buy consumer, rather than the in-

terested aficionado the independent dealers like to think of him as.

One thing the big stores won't do is take a gamble on future profits based on the as yet unseen revenues from an emergent, still largely unprotected, software market.

This argues that Tramiel can actually build his machines for even less than US industry analysts calculate, and is selling them for less than anyone has so far revealed.

Back at Sinclair Research, we still have a predominantly hardware-oriented company, pursuing profits through low cost peripherals and low priced hardware sales.

There is no sign that Sinclair is ready to convert Sinclair Research into a mixed hardware/software company, though.

The issue of who is right is likely to be decided in the huge retailing chains of the US, where price is high and sale is cheap is still, as ever it was, the received wisdom and gospel.

On balance, the US analysts, still shell-shocked from the divestiture of Atari and the decimation of Texas Instruments, are teetering towards the view that, while Commodore may win greater market share, Sinclair will win a position equivalent to the one now held by Sharp and Casio in the pocket calculator market.

Interestingly, there is no sign so far that the Japanese either understand or intend to compete seriously in this new home and home micro market.

Only Sord has introduced a Sinclair look-alike in the West, the MS, and that machine, at £150, looks very overpriced compared with the Sinclair Spectrum, now costing less than £120 for the 48K version.

NBC has a range of small home and personal micros widely available in Japan, but has made no

attempt to introduce them in the UK yet.

Is Jack Tramiel prepared to war against Apple, IBM and DEC? They truly have the big bucks, but have they the right strategy?

Tramiel says that he isn't going into battle directly against the three, but then one of the trademarks of the Tramiel strategy, as stated and then carried out, is that in the classic mode of light infantry, he can change direction and speed with total disruption.

Texas Instruments went down because it got not only its price wrong, but prior to that, its product manufacture.

There are plenty of those who doubt that Apple, still with the status of the Apple II, would have got its cost of production, least of all by asking £8,000 for a Lisa.

Tramiel has frequently promised his power man's Lisa, Magic Desk, and just as frequently failed to deliver it.

But what is certain is that Tramiel will deliver the Lisa, and that it will help to define the aggressive edge of the Lisa line.

IBM, despite its amazing sales to date, remains mainly dependent on "corporate" orders, and are still down there on the cash flow Tramiel and Sinclair.

Now are they ever likely to? Both Tramiel and his highest val are pursuing the personal division, and benefiting both from the parallel market in personal software that has made the personal machines more attractive to the games machine specialist developed for the games market.

Tramiel has also had a lot of possession of a hand-held device 256K, 32-bit microprocessor.

When that little device is who is going to pay \$1,000 for 128K of 16-bit device? Even competition such as it is.

MORE BYTES THAN LONDON ZOO!

THE PDP-11/23 PLUS

GRRR!

Rapid Recall

When Digital designed the flagship of their LSI-11* bus range, they packed in quite a plus - that's a massive 4 Megabytes of machine memory.

That lets you run top end minicomputer software like RSX11-M* Plus and RSTS-E* and of course RSX11-M* and RT11* on the extended 22 bit LSI-11* bus. And that's a first for a micro based system in this price range.

But if you're worried about grabbing a tiger by the tail, don't. The PDP-11/23* Plus is handled by Rapid Recall. Phone them today and you'll go wild about their prices and ex-stock deliveries - plus all the support you need to master your system from day one.

Kevin Cahill: The home computer will not stay in the home.

French technology faces its most sweeping reorganisation

Jack Gee predicts there will be a massive concentration of French muscle in the electronics, IT and energy industries

THE most sweeping reorganisation of France's high technology industry since world war two has entered its final planning stages in board rooms and government offices: the outcome is likely to be a massive concentration of muscle in electronics, information technology and energy, the sectors on which the competitiveness of the French economy depends.

New battle lines are being drawn between the two most powerful firms in these key industries, Brandt and Compagnie Generale d'Electricite (CGE), both of which came under state ownership 18 months ago.

Georges Peberau, 52-year-old managing director of CGE looks like emerging as the winner in a contest for power against Alain Gomez, chairman of Thomson and eight years his junior.

Thomson's activities in information technology, office automation and telecommunications seem on the verge of falling into CGE's lap. Thomson is expected to take over CGE's military equipment division and to concentrate on electrical and electronics consumer products ranging from kitchen cookers and videotape recorders.

CGE's assumption of command over leading edge technology reflects its outstanding performance as the only nationalised firm which reported a profit last year.

Its 190,000 workers, whose jobs range from building nuclear generators to selling digital time division telephone exchanges, earned the group 638 million francs (£53 million) in 1982. Thomson, with a staff of 129,000, lost 2.2 billion francs (£183 million).

The division of the spoils between Thomson and CGE is the result of a cannily-played game of Monopoly which has engaged Gomez and Peberau throughout the summer, with Minister of Industry

and Technology Laurent Fabius, President Francois Mitterrand's favourite whizz-kid, as umpire.

Government officials say they are waiting for the two corporation chiefs to present their proposals and are not involved in the negotiations. But senior civil servants, including Peberau's brother Michel at the Ministry of Economy and Finance, are known to have spurred the business chiefs on.

Massively indebted socialist France cannot afford to pour huge subsidies into loss-making business activities which are being conducted on a grand scale by nationalised industry, particularly at Thomson.

Industrial observers say the French telecommunications industry will have to shed 22,000 surplus workers over the next year.

Massively indebted socialist France cannot afford to pour huge subsidies into loss-making business activities which are being conducted on a grand scale by nationalised industry

following the shrinkage of orders for the successful E10 telephone exchanges built by CGE's subsidiary CIT-Alcatel and the failure of Thomson's MT 20 and 25 exchanges to make any sizeable dent in the world market.

French Telecom and Thomson recently flew a group of French pressmen to Chile to show their switching system operating in riot-torn Santiago — one of the few world capitals where it is function-

ing without serious technical problems.

Thomson's problems are symbolic of the failure of nationalisation to produce the incentives to investment and employment which President Mitterrand set the big names of French industry when the state took them over.

A report by the National Statistical Institute (NSI) published last week says: "Staffing in the public sector is shrinking just as fast as in private industry."

Until nationalisation, investment in the public sector was more sustained than in private firms, the institute recalls. But in 1982 investment dropped by 8% in state-run businesses and 7% in the private sector.

Although Thomson's problems did not all begin under socialism, those of its biggest subsidiary Thomson-CSF which embraces the military and computer markets, are newcomers. Thomson-CSF registered the first losses in its history in 1981.

In the framework of efforts to establish a viable computer industry in France, Thomson's minicomputer division was handed over to Bull, in which the state holds 80% of the equity and Honeywell the remaining 20%.

However, the group retained its military computer activities. These are not scheduled to be transferred to CGE which is negotiating with Olivetti in order to acquire the 35% stake in the Italian firm previously held by French glass-maker Saint Gobain.

In the redistribution of responsibilities now under way CGE can be confident of developing France's nascent office automation industry in co-operation with Olivetti.

CGE's managing director Peberau gets on splendidly with Olivetti's chief executive Carlo De Benedetti, for whom he has immense admiration. French industrial observers say the two men are cut from the same mould and have similar talents for man management.

Gomez, grandson of a Spanish anarchist, has a different approach. "Over the years I have derived genuine pleasure from firing incompetent managers and people in charge who put at risk the employees who enjoy no responsibility at all," he says.

Gomez played a major role in the socialist party as an economic adviser to Mitterrand until the change of government in 1981. But Thomson's poor performance could sound his doom.

He recently uttered what might prove to be his own epitaph at Thomson: "A boss who succeeds is somebody who is able, with the same men, raw materials and environmental and market constraints, to get more productivity and added value. More profit, if you like. That means rigor and discipline but also orderliness."

Even if Thomson retains its military division, which is heavily dependent on computer technology, this is unlikely to restore the firm's finances to good health. Thomson-CSF steadily turned in profits until two years ago by taking 40% advances from Arab states for military orders and then earning money from the bank by investing it. Now, with only 10% paid on signature of contracts, this source of plentiful revenue is no longer available.

The transfer to CGE of its telecommunications division, although the source of massive losses, would be a serious blow to Thomson which only recently acquired ITT's nationalised Telecom

Any tranquility enjoyed by French technology is soon to be shaken.

activities. The jobs of at least 6,000 of the 8,500 employees of ITT's subsidiary Compagnie Generale De Communications Telephoniques are now considered to be in

The division of the spoils between Thomson and CGE is the result of a cannily played Monopoly game between Gomez and Peberau with Mitterrand's favourite whizz-kid Laurent Fabius as umpire

FABUS... Minister for the Budget

serious jeopardy. Senior executives at Thomson who got warning of the talks about between Gomez and Peberau have taken evasive action where they have been able to do so. A number of top telecommunications specialists moved from Thomson to CGE in recent weeks.

If CGE becomes overlord of the French telecommunications industry, as now seems probable, there will be gnashing of teeth at the Ministry of Telecommunications. Telecom minister Louis Mexandeau successfully fought France's last industry Minister Jean-Pierre Chevènement's efforts to marshal Thomson's and CIT-Alcatel's activities under a single umbrella company which would have been dubbed Telephone de France.

Now, only six months after Chevènement was dropped in a government reshuffle, his plan looks like reaching fruition.

But French Telecom is hostile to the prospect of having no choice between rival telephone switching systems or other equipments. Export customers will certainly react in the same manner.

It is still unclear what roles will be reserved for computer maker Bull and Matra, a leading electronics firm in which the state has a 51% stake, following a carve-up of high-technology activities between Thomson and CGE.

Thomson has been promised that it will retain its leading role in developing electronic components. But it is not yet able to supply the French industry on a big scale.

CGE's position on the French Monopoly board is likely to be further reinforced if its chairman, Jean-Pierre Brunet, takes a career position in the French nuclear industry.

The company makes the generators from France's pressurised water reactors which were developed from Westinghouse technology. General de Gaulle chose the American PWR design in preference to CGE's boiling water technology in the 1960s.

CGE again found itself on the sidelines in 1975 when President Valéry Giscard d'Estaing ruled that Framatome, a subsidiary of the Creusot-Loire firm which is itself part of the Schneider-Espaign group, should be France's sole reactor builder.

Now Schneider, which lost 60 million francs (£48 million) last year from its steel activities was to divert itself of this burden. The government is ready to hand over the foundries to the state-owned Sauter and Usinor steel firm. In exchange Schneider would get 35% of its 70% stake in Framatome to CGE.

France's publicly owned generating authority, Electricite de France, and the French state energy authority, which has a 3% holding in Framatome, oppose a move which would strengthen CGE's hold over the nuclear industry and give it a monopoly role.

But the concentration of power at CGE and the specialisation of electronic consumer production at Thomson are regarded by many industrial observers as a logical solution. "Franco-French competition" (meaning contests between French firms for foreign orders) has been a bogey phrase of the government since it took office.

As other European firms ally with the Americans and Japanese to safeguard their markets, the division of labour between CGE and Thomson looks like a rational answer to present day problems.

The one and only R.

Cullinet's relational database for IBM computers. It's called IDMS/R.

IDMS/R is the single solution to the two sided problem of providing useful database applications for both end users and production tasks.

This is how it works:

As a true relational database, it allows you to select data from separate and unrelated files; join it, then project it in ways that make it possible for you to handle end user applications and unstructured requests for information quickly, directly and intelligently.

As a superset of Cullinet's proven network database, IDMS/R allows you to handle high volume, production applications with the network technology best suited for the job. It's this unique marriage of architectures that makes Cullinet's relational database stand apart.

Where others have tried to propose relational or psuedo-relational components that exist separately from the

production database, Cullinet's is the only one that lets both work together. Thus serving the whole corporation by serving all of the needs within it.

IDMS/R.

To get everything out of the database that you've put into it, the answer is software.

And software is Cullinet.

TALBOT... "Trouble with our approach is that every silver lining has its cloud".

The directors of the Alvey programme, the national five-year plan for the fifth generation of computers, are now setting up an internal communications network based at their Millbank headquarters in London. By next week all the key people in the scheme will have their own workstations which will later be linked by British

Telecom's PSS to the remainder of the participants. The network will provide an electronic mail service using SERComm, the Science and Engineering Research Council's system, initially based on the so-called group protocols. These are protocols developed by the universities' computer board, which will eventually be modified

'Japan thinks 20 years ahead... we think in months'

THE software business should be able to offer users the same improvement in value for money as they have had in hardware over the past 20 years.

This is the firm belief of David Talbot, who is to be responsible for developing British expertise in the programming field to compete with international competition.

He was a programmer himself in pre-Cobol days, having entered the fledgling industry 23 years ago after reading maths at Oxford. He made a false start to his career in the Air Ministry as a scientific officer before deciding the interesting work would not compensate for the low pay. Keen to get in at the beginning of a new subject, he considered joining Bull or ICL, but opted for the freshly-established ICI.

He helped to install some of ICI's earliest systems, including a tape machine for the pharmaceutical firm Pfizer, eventually being promoted to technical support manager in Leeds. During his seven years in the North, ICI progressed by swallowing English Electric, EMI and Ferranti's computing interests, and emerged as ICL. While this was happening Talbot switched from the technical to the business side and became ICI's business manager in Leeds. Returning South in 1974, he was closely involved in the creation of the 7500 mainframe series and in finding its first customer, the Defence Ministry.

Technology firms to government in long-term undertakings. "Unlike Western economies Japanese are thinking about 20 years ahead, while we are worrying about the next 6 months. The trouble with our approach is that every silver lining has its cloud."

Not even IBM could "go alone" in this climate of intense international rivalry, said Talbot. ICI's language, designed to supersede Cobol and Fortran, yet being different from both, was a strength.

"The moral is that we have to serve one another's real needs, hang together or be hung apart," he says. "The message going through the trade now."

Therefore the Alvey team will not be developing a new language or operating system but concentrate on creating software tools that people would use.

"When I came into the industry with machine code and a biro, you had to spend a million pounds on hardware to get anywhere. Now we need to bring about the same improvement in software

When I came into the industry with machine code and a biro, you had to spend a million pounds on hardware to get anywhere. Now we need to bring about the same improvement in software

In the latter half of the decade he took charge of liaison with the universities, government departments and the Common Market. With the arrival of Robb Wilnot as managing director he moved to Slough to become business manager for mainframes.

Now he is on secondment to the Alvey team at the invitation of its director Brian Oakley - but will not decide until the end of two years whether he needs to prolong the sabbatical.

"I didn't expect to be offered this post as I had not been doing the groundwork for the project. But I thought it was of such importance that I was flattered and enthusiastic about joining."

He admitted that other countries had begun their fifth generation effort earlier and were spending far larger sums, both from public and private sources, but he argued that the issue was not the amount invested but whether we got value for what we spent.

When in West Germany he was impressed by the amount of government was putting up for the computer industry - but noted that it might well have regarded its early results as disappointing. The Germans looked to the UK where they regarded the relationship as exemplary.

Both the Germans and French had come to recognize that data processing - soon to be rechristened information technology - was a cash-hungry business in which world standards would apply.

It's a thousand pounds. We need to bring about the same improvement in software

People had prophesied the Cobol would bring about the demise of the programmer and would mean that managing directors would soon be talking directly to their machines. The reality has been that there was no such dramatic progress in software, it matched the advances in hardware.

A tenfold improvement in productivity was not a sufficient inducement to DP managers to switch software, he said.

He was looking for a breakthrough in formal specification methods, an area that had received less attention in Britain than in the US up to now. "Most jobs come in crumpled before the first line of code is out," he said.

And the reliability of programs must be defined and measured accurately as was hardware performance - another field that has been seriously under-resourced.

He will also be inquiring into ways of ensuring that the techniques are fed back into commercial use. He wants the government to play a leading role in encouraging its adoption, as the MoD has already done.

He wants to introduce a method of getting the more expensive items of software for a trial period to reduce the investment risk that so often have deterred organisations from taking on new and better systems.

ALVEY UPDATE

the directors to bring them in line with International Standards Organisation protocols.

Derek Barber of Logica, who is the director responsible for the Alvey programme's infrastructure and communications, is organising the publication of a regular Alvey newsletter.

As the directorate prepares to put the fifth generation show on the road, two of its directors, David Talbot, the software engineering chief, and Chris Barrow, who takes charge of the man-machine interface aspect, talked to George Black about their backgrounds and their hopes for the plan. . . .

My role - to make the research staff work in harmony

BARROW... "A lot of businesses have shunned new technology just because the man-machine element wasn't right".

I think fear is the principal impetus behind this. It's a pity perhaps that it has to be so, but what will really influence people to get their act together is fear of being overtaken by the Americans and Japanese

for the report prepared by John Alvey of the Post Office.

Why was he chosen? "I think one reason was my great interest in long-term research and development and my connection with the Common Market's Esprit project."

He represented Plessey on Esprit's office automation panel, one of the committees set up by the 12 major European companies backing Esprit. He described himself as a convinced European and said taking up the Esprit post had been "like putting on an old shoe for me".

He thought it very important to ensure that the two endeavours were co-ordinated so that their labours were complementary and not duplicated.

How did he define the man-machine interface? He outlined three main broad areas of work that he would include in it. The first centred on human factors: "This is the area that is now normally called ergonomics in which we have to consider the cognitive aspects of the problem. We have to increase the mutual understanding of man and machine and we have to tackle the organisational prob-

lems of many users all on the same machine."

The second area was that which encompassed pattern recognition, image processing, speech recognition and synthesis, and script recognition, topics which the National Physical Laboratory among others has been active in researching.

Thirdly he cited display technology as a field in which progress could be expected. The universal acceptance of cathode-ray tubes as the means of display could be challenged by flat-screen alternatives operating at low voltage.

Two main advantages of the flat screen could be that it could be incorporated into the desk - "it could be the real desk-top computer at last, in fact" - and that it allowed users to write directly on to the screen.

A general strategy document covering all three of these areas is in preparation now and is expected to be issued by the Alvey directors by the end of November.

It will identify the areas in which research work will take place and make recommendations on how the man-machine interface community can best be brought

enhancing the attractiveness of products to users, he emphasised. "Sales of products are very dependent on what we can achieve in the MMI area. We must remember that a lot of work is going on in the US to attack these problems, especially in companies like Xerox and Bell Labs."

He agreed that the Americans were spending far more money on the next generation of computers than the British, but said it was still far too early to judge what the result of the race would be.

"It's easy enough for anyone to give an opinion on whether we're spending too little too late - but it's harder to actually back up that opinion with sound evidence. The truth is that only time will tell."

There was a right and a wrong time for launching such programmes, he argued.

Probably three or four years ago there would have been a general reluctance to participate in such an undertaking, even by those who were now saying it was too late.

The objective was that in five years time, when the penetration of computer technology into industry would be far greater, they would be able to support much more user-friendly products.

"We can reduce the resistance of the consumer by making things more usable. There is a limit to how many systems you can simply

shovel into the mouth of the consumer. A lot of businesses have shunned the new technology just because the man-machine interface element wasn't right for them."

The diverse MMI community spanned several disciplines - from psychology to physics - and several different types of industry, from the design of cockpits for military aircraft through to terminals for secretaries. His role was to make the researchers work in harmony.

Esprit had gone forward pretty fast considering the many difficult problems it had to overcome, he said, but Alvey might be able to advance faster because of its smaller team. All the top staff are concentrated together in a few rooms at Millbank.

The willingness of companies to get together and pool their resources has been impressive both in Esprit and in Alvey, he said. People had begun to see the advantages of working side by side and reducing the risks involved. This was significant because scientists generally had in the past looked to the US for an example, rather than to their colleagues closer at home.

"I think fear is the principal impetus behind this. It's a pity perhaps that it has to be so, but what will really influence people to get their act together is fear of being overtaken by the Americans and Japanese."

If your computer gets stuck in a dead-end job you clearly haven't got dBase II.

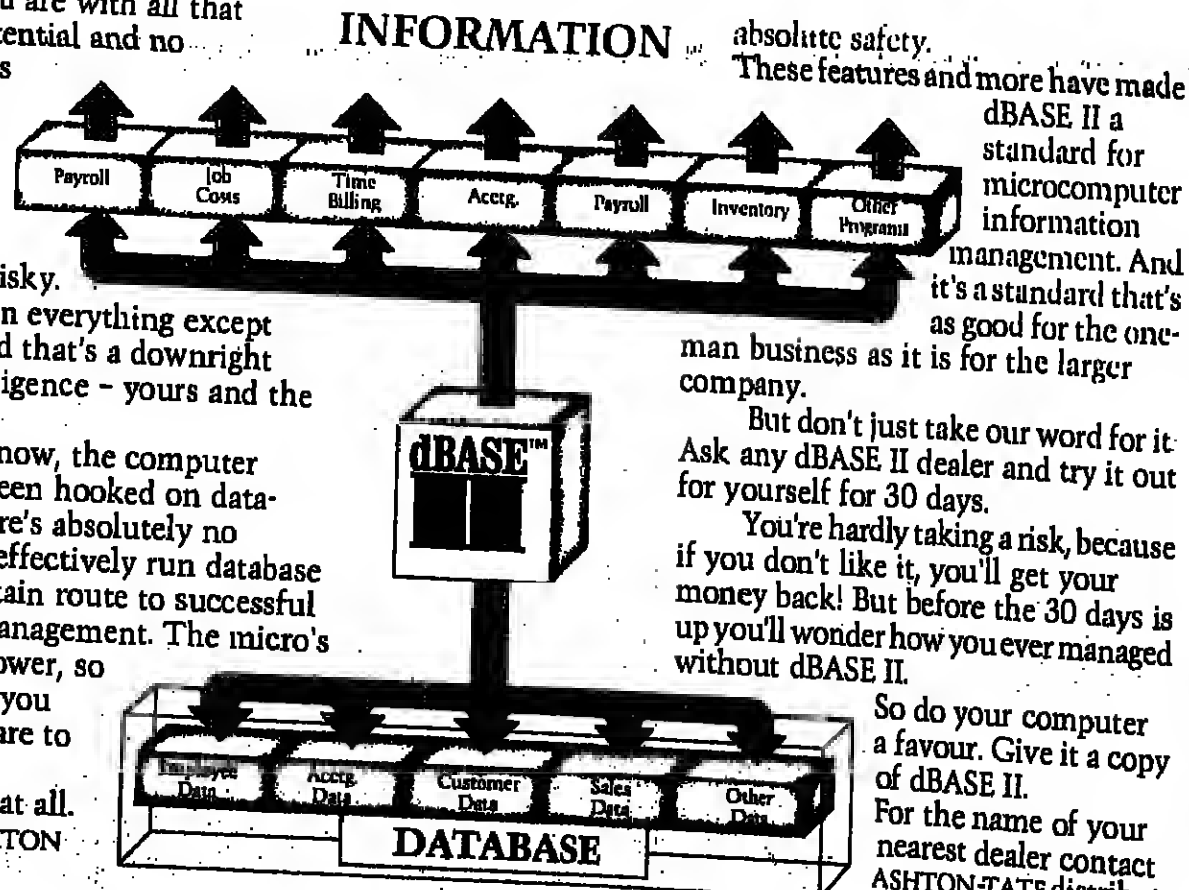

There you are with all that microchip potential and no software that's man enough to exploit it. Too specialised, too basic, too difficult, too risky. Over the top in everything except flexibility! And that's a downright insult to intelligence - yours and the computer's.

For years now, the computer industry has been hooked on databases. And there's absolutely no doubt that an effectively run database is the only certain route to successful information management. The micro's got the horsepower, so why shouldn't you have the software to go with it?

No reason at all. That's why ASHTON-TATE developed dBASE II.

With dBASE II you can harness all your microcomputer's potential. It gives you a flexible structure on which to build business information and a straightforward means to develop complex and varied applications. In short, dBASE II gives you all you need to manage and use information.

When your business grows, you can change the way you handle information without changing the information itself. You can develop your own applications or buy them in ready-made. You can even build a set of menu-driven routines and let untrained people loose amongst your most valuable information in

absolute safety. These features and more have made dBASE II a standard for microcomputer information management. And it's a standard that's as good for the one-man business as it is for the larger company.

But don't just take our word for it. Ask any dBASE II dealer and try it out for yourself for 30 days.

You're hardly taking a risk, because if you don't like it, you'll get your money back! But before the 30 days is up you'll wonder how you ever managed without dBASE II.

So do your computer a favour. Give it a copy of dBASE II.

LET PARCELSPEED GIVE YOUR PRODUCTS 'THE RUSH AROUND'

COLLECTION AND DELIVERY OF URGENT PARCELS WITHIN 24 HOURS

You require a collection - and next day delivery service that's fast, reliable and competitively priced. You need Parcellspeed. Just one label per package and one consignment docket is all we need. We'll rush around, collect and deliver within 24 hours during which time we keep track of progress by computer.

Parcellspeed, the ideal service for meeting all your delivery deadlines without spending a fortune. Give your product the "rusharound" and call Bernie Mason on 021-359 0551.

NATIONAL CARRIERS PARCELSPEED

A Member Company of the employee-owned National Freight Consortium plc.

Cobol generator goes on micros

by Claire Goodlog
ONE of the first Cobol applications generators to make its way on to microcomputers is to be distributed by Cobol firm Micro Focus. The Sourcewriter applications generator from Softwright is to be sold alongside Micro Focus' range of Cobol products for a single-user licence fee of £750.

Micro Focus already has a loose marketing agreement with In-

ANDERSON... "I will not produce gobbledygook code".

formation Systems Research Inc for the RIMS/MPG Cobol generator, which works across a range of DEC kit. Sourcewriter at present works on a variety of Z80-based microcomputers, including those running CP/M and MS-DOS, and the IBM Personal Computer under PC-DOS.

According to Micro Focus marketing manager Peter Hewitt, the two products will not conflict, partly because the sales relationship is closer in the US than in the UK. "There's such a wide market ready to be tapped that the two systems won't need to compete. RIMS tends to sell into end-user sites; Sourcewriter is aimed at technical users at the analyst level."

Like RIMS/MPG, Sourcewriter generates code which can be amended by hand. It works on a data dictionary principle which allows the system to establish complex relationships between individual data items.

"Sourcewriter is closer to being an applications generator than a code generator," said product author Martin Anderson.

"It grew out of mainframe techniques and is designed to use fairly intelligent fourth generation ideas, centring on database," he explained. "Apart from being the first product of such sophistication available on microcomputers, it is unusual because it starts with the data structure: top down design, in other words."

Sourcewriter designs the files and then the programs in detail, allowing the designer to change screens and even more rigorous specifications as the system develops. This "prototyping" ability is not common among applications generators.

"Another feature which makes Sourcewriter unique is that it will not produce gobbledygook code. The chances are that if a program compiles it will be sensible and run properly," added Anderson.

The product generates source code in CIS Cobol which can then be compiled using Level II or CIS Cobol compilers. Tests quoted by Micro Focus show that using Sourcewriter, between 500 and 1,000 tested lines of Cobol per man day can be produced.

CMG caters for the air freight industry.

Air freight system takes off

AN air freight system designed to corner the market has been launched by CMG Information Services. The system is under development at the Greenford branch of CMG, which overlooks Heathrow Airport.

Apart from having air freight on its doorstep, CMG was prompted to develop its CMGAIR system because it felt that no one supplier had managed to meet the specific needs of the air freight companies. "The system has been de-

veloped alongside the air freight forwarders themselves and is being tested at one of the world's largest air freight firms," explained CMG Information Services joint managing director Chris Heanessy.

"We've designed it for medium to large companies which felt their needs weren't fully catered for." CMGAIR works on IBM System 34s, and costs about £25,000 for the basic package, and £32,000 for the System 36 version. Installation and maintenance cost

an extra £10,000, but CMG is convinced that the benefits of increased profitability more than justify the outlay.

The system can cope with different inputs such as telephone bookings, and shipping instructions, right up to the export of consignment. The various modules dealing with freight operations, accounting and job costs are all integrated so that data is automatically passed between them.

Perkin-Elmer makes the queries easier

SUPERMINI manufacturer Perkin-Elmer has taken another step towards programmerless programming. It has added a query facility aimed at end users as an extra option in its Reliance relational database.

The Reliance Update System, RUS/32, accesses the Reliance Plus database so that staff can create, update or delete records as and when they wish.

Perkin-Elmer has been strengthening its software offerings as part of the move away from the scientific and engineering image and into commercial Unix-based systems. The Reliance Plus database was developed in the UK for online transaction processing and database management, and has been a major factor in Perkin-Elmer's push to become a supplier of total systems.

"We're committed to supplying

products for increased programming productivity," explained marketing manager Fred Mascarenhas.

"The long-term goal is to reach the point where you can eliminate programmers from the process altogether. No-one's got there yet, but we are moving close with this sort of tool."

RUS/32 follows the fill-in-the-blanks technique, which means the user simply has to follow the screen prompts. There are help messages to guide how to fill in the screen forms, and an inquiry key which displays the names of files, fields and other items which have to be entered.

As well as launching RUS/32 Perkin-Elmer has improved its reporting and query facility RQL/32 so that parameters can be used to ring the changes on queries that have already been saved.

MURRELL (left) and MORRIS... Opening up new market.

20 outlets planned for time costing system

TWO Norwich accountants are so pleased with the time costing system they have been using that they have set up a new company to market it.

They are John Murrell and Mark Morris, of Shemur Management Systems, who have had their system, SMS Time Costing, enhanced and packaged for dealers by software specialist Rak - who happen to share the same office.

The original program was written by Peter Dearnly, a lecturer in computer studies at the University of East Anglia. Now it has been added to by Richard Webb, director of Rak, for selling mainly to medium-sized solicitors and accountants' practices of between two and ten partners.

Morris said they had been surprised to learn from professional colleagues that few packages in use had the time-costing feature, though it was fundamental to all their work.

"We did some market research and found that a lot of them lacked the necessary management information and did not have straightforward reporting," he said.

"Not enough thought had been put into them in the race to sell the hardware. But we've been through the learning curve ourselves. We don't live in cloud-cuckoo land."

Now they are establishing a dealer network for the new product, intending to have at least 20 outlets. The program is in Micro Focus' CIS Cobol and runs under MPM micro operating systems.

Morris said it could be used by any business where time was being charged, down to units of six minutes, so architects and advertising agencies could be interested.

"What we've done is take out the tedious manual labour and provide some very simple reports," said Morris.

UK company bids for micro database market

by Claire Goodlog

A NEW UK company is aiming to break the US stranglehold on the micro database market with its own relational database and applications generator.

Datalt, described by its originators Datalt Ltd as "a total methodology, not just a program generator," is being launched in London this week.

The team behind Datalt comprises two systems programmers, Chris Belk and Tony Montgomery-Smith, and public relations consultant John Brace. Their interest in fourth generation software techniques led to an experiment, for which Belk and Brace bought the computer. After three years of development, the experiment had developed into a fully fledged product, and the three are now building Datalt into an international company.

The product won the backing of Barclays Bank, then the NCC Software Products Scheme, which matched the personal investment made by the Datalt team with a £160,000 grant.

Datalt is aimed at small companies which cannot afford an in-house programming team, as well as the large conglomerates which use distributed database techniques as well as central processing.

"It's for the six-man company, right up to the multinationals," explained Belk, who is a director

of Datalt.

The system is selling for £100 to £10,000 including the Comm Communicator on which it runs, live or 10 Mbit disc, printer and applications.

The price puts Datalt into the same category as the "adult" micro databases such as dBASE and dBase II, rather than competing with data management systems like Ashton Tice's dBase II. "Hopefully we are offering the kind of service that hasn't been available to micro users before now," said Datalt operations manager Michael Cross. "It's difficult to compare it with anything."

Datalt's unique ability, according to Belk, is that the system allows "prototype" applications to be built interactively. Specifications can be changed as the user decides exactly what the requirements are, and the software can go on changing even when it is up and running.

Datalt consists of one large unit, which can be added to or changed in any way. "The whole system is motivated by mainframe principles," said Belk, "and we've managed to put them down on to micros. There are practically no limits to the complexity of the applications Datalt can produce: if you write it by hand in Cobol or Pascal, then we can provide it."

Database writes fly

A FOURTH company has been pulled into the £500,000 lawsuit surrounding a magazine review of Bristol Software Factory's Silicon Office microcomputer database system.

Bristol Software is now seeking legal advice on possible action against another database firm, Compsoft, which is using extracts of the review in publicity material.

The lawsuit is against Personal Computer World magazine and reviewer Dr Kathy Lang. Bristol Software claims the review had 13 errors and that it has cost £500,000 worth of business since it appeared in December.

The company is also applying for an injunction against Microcomputer Business Systems

to prevent it using an allegedly misquoted version of the review in promotional literature.

But Compsoft said Lang was the industry's most respected and thorough database reviewer. Its Delta product came top in some select tests. It sent extracts of the review to its existing and potential dealers last week.

"We think Bristol Software has a very good product and I like the people there," said Compsoft marketing director Heather Kenney. "We're not even in direct competition."

She added: "I hope this case won't prevent magazines doing these independent reviews, because they are very valuable to the industry."

Sound business sense for volume buyers

The Autumn Computer Trade Forum is the UK's largest and most successful trade event and the only show that fully understands the needs of volume buyers.

It offers you a comprehensive display of minis, micros, software and peripherals in an environment that's specially made for volume business.

Who is CTF for?

Distributors. Dealers. Software houses. Systems Integrators. Retailers. OEM's. In fact anyone who makes a living buying and selling computers, software and peripherals. So whether you're new to DP/WP or know the business backwards, CTF is the event you mustn't miss.

How can CTF help you sell more?

The exhibitors at the Computer Trade Forum understand your needs. That means they'll be talking your language. Quantity terms. Discounts. Marketing support programmes. Delivery schedules. The whole range of services to help you sell more.

Who will be at CTF?

Texas Instruments. Logica. DEC. Systime. DRG. Zygol. Motorola... and many more! And for every name you know there'll be many you don't - with products that could well be your next year's big seller.

Why CTF is different!

The Computer Trade Forum is the only show that understands what volume buying really means. The atmosphere, the choice of exhibitors, the absence of

razmatazz are all designed for profitable business.

CTF has been specifically designed for you and as a proven, established national event it offers you even more with the support of leading UK suppliers.

Post the coupon today

The general public is not invited to CTF. The emphasis is on volume business. And for you it's free! Just fill in the coupon and we'll send you free tickets (worth £3.00 each) by return of post.

If you need to know more, call 01-747 3131.

Computer Trade Forum
232 Acton Lane, London W4 5DL

Please send me free tickets for myself and colleagues.

COMPANY NEWS

Network firm wins £250,000 investment

by Caroline Burgess
BEALE Electronic Systems has secured £250,000 of new investment to enable it to continue the development of Hilan (high integrity local area network).

Hilan is being developed by Beale with the aid of Seicon. Beale, which specialises in equipment for industrial environments, claims that Hilan will overcome the problems of dirt, heat, explosive atmospheres and breaks to cables. It will use fibre optic links rather than conventional Ethernet cable.

The new investors are Thames Valley Ventures and Investors in Industry (formerly Finance for Industry). Most of the money will come from the former. Directors of the company are also increasing their investment.

Roger Beale, one of the directors, said: "It would not have been impossible to continue with the Hilan project, but difficult. We can now speed things up."

Nicholas Beale, managing director, said: "This investment will be used to expand the company, to aid in capital investment and to finance our development programme."

"The Hilan project is exciting considerable interest here and in America, where I had talks with a number of major US companies," he added.

At present Beale employs 20 people, half of whom are working on the Hilan project. Its aim is to double turnover each year, reaching £1 million by 1984 and £2 million by 1985.

Battle of giants due next week

by Kevin Cahill
IN a week's time Dr Lewis Branscombe follows Dr Gene Amdahl as the keynote speaker at the International Information Processing Conference in Paris.

The scene is likely to produce the first public confrontation between Dr Amdahl and IBM since he founded his new IBM compatible mainframe company Trilogy two years ago, and will be the focus for perhaps more attention than IFIP has previously experienced.

Amdahl is now informally talking about a 40 million instructions per second (mips) uniprocessor for delivery in 1985, while the best that is expected of IBM is a 14 mips machine in the same year.

Not only will Branscombe be on the spot, since the performance of the IBM machines is his direct responsibility, but there is some speculation that IBM may try and use the occasion to begin their counter campaign, to the Trilogy machine.

But there is far more at stake than just a debate between two eminent scientists about whose technology is faster.

Branscombe told an audience in Germany last month that "the computer power demand on the data processing facilities of our largest commercial customers is growing at 40 to 60% a year." This

meant, Branscombe said, that IBM needed to produce the highest performance processors for the commercial world "that our technology permits."

He is now facing an unprecedented challenge from Gene Amdahl to prove that IBM can deliver the high power it speaks of.

Branscombe's problem is that, despite the huge resources of IBM, he does not have the time to attend the company's design programme for the Sierra, as the IBM answer to the Trilogy range has so far been called.

The Gartner Group recently produced an analysis of the Trilogy technology which showed that, by implication, it would be many orders of magnitude cheaper to manufacture than IBM's comparable technology.

The Gartner assumptions were based on the relative cost of the substrate board in the IBM machine, which carries all the inter-chip connections, and the Trilogy chip, which internalises the substrate board into the chip itself.

Beyond the technology issue there is the role many commentators believe IBM has taken on of being the technology leader, and IT representative of the US in the world — summarised by one magazine as an attitude of "what's good for IBM is good for America."

AMDahl... Talking of a 40 mips uniprocessor by 1985.

When Branscombe spoke to the scientists in Germany he also referred to the need to provide networks so that scientists could remotely access supercomputers.

If this is any indication of how IBM intends to approach the supercomputer issue, then he is in for a further surprise from Trilogy.

The Trilogy machine range will come with a 100 mips array processor as virtually standard equipment, so Gene Amdahl is not leaving the bottom end of what Branscombe himself referred to as "the explosion of applications variety" in supercomputing, to the Crays and CDCs of this world.

Datastream beats forecast with £2.3m profit

by Philip Hunter
INVESTORS in computer information specialist Datastream which went public in March, not complain about the company's results for the year ended last April. Pre-tax profit was £2.3m against a forecast of £2.2m from analysts for the period.

The figure is 64% up on last year's £1.43 million profit. Turnover was also well up, 24% from £8.26m to £10.23 million.

But the directors admit that performance of the share has far been disappointing. The rise to 210p on the new listing has still not covered the price of 225p, when the company came nine times overvalued in the market.

The official company statement says that the age of the technology has been a major factor in the share price. The company is now working to improve its image.

Gene Amdahl is scheduled to speak about the history of computing, a good deal of which he was personally responsible for building, both when he was at IBM and later.

Computer Weekly will be on the spot to bring you details and analysis of what promises to be an historic encounter of the supercomputer kind.

SHARES TABLE

The shares table, which is specially compiled for Computer Weekly, lists selected computer companies that reflect the state of the computer industry.

Company	Share Price	Change
Acorn Computers	180	+
Amstrad	120	+
Atari	100	+
Bull	150	+
Cambridge Scientific	110	+
Cassini	90	+
Centronics	80	+

The table shows the closing prices on Thursday. The share index is based on the price of the shares in the table. The share index is based on the price of the shares in the table.

MICRO NEWS

CCTA opts for Sony disc drive

THE government's Central Computer and Telecommunications Agency (CCTA) has settled on physical specifications for a recommended microfloppy disc drive. But its choice from the clutch of contenders in the sub 4-inch stakes, Sony's 600 rpm 3 1/2-inch drive, is the least well supported. Even Sony is seemingly moving away from this drive in its attempts to promote standards worldwide.

"At the moment we have just decided on the basic specifications," says the CCTA's Dennis Morley — who has responsibility for advising government users on microcomputer hardware. "If any department wants microfloppies and sees a need to interchange data

with others, it should go for this drive."

In the Sony camp this seal of approval from the CCTA is welcomed. "It is one of many build-ers that will start rolling towards standardisation," says marketing manager Robin Allison. "Perhaps it will affect governmental agencies elsewhere."

Already commercial organisations outside the CCTA's original group look like joining the bandwagon. The Inter Bank Research Organisation has contacted Morley, and the National Computing Centre has offered to work on recommendations for logical formats.

But rival drive suppliers Tabor and Hiuchi believe commercial

The superminifloppy is destined for UK

by Keith Holder
FLOPPY disc drives which cram 3.3 Mbytes on to a standard high quality 5 1/4-inch disc will hit UK OEMs next month. The "superminifloppy" from California-based Drivettec will be available in the UK through Ambar Systems for around £480 in single units, dropping to £350 for bulk orders.

The drive can also operate as a lower-capacity industry standard, allowing users to read existing discs. In the high capacity mode, a 500 Kbit per second, 160 millisecond average access time is offered, made possible by some novel access features.

Joe Adam, Drivettec's vice-president of marketing, said: "Systems integration people have been pushing for this product. It offers two to three times the capacity at a 40-50% premium, which makes it very cost effective."

This increased capacity will allow one drive to replace the Winchester disc with floppy disc back up at the low capacity end of the computer spectrum.

Winchesters have severe requirements for cleanliness, not needed with the floppy drive, and carry a significant cost disadvantage.

The combination of a high precision servo track following system, low wear gumball heads — with rounded corners — vertical media clamping and a patented backlash positioning system allows the drive to read and write 192 track per inch standard media

discs with high reliability, says Adam.

The heads read servo information on the disc which, using an eight-bit 6805 microprocessor, compares the signal intensity between two tracks and adjusts the position of the heads until these are equal. Then the heads are centred.

This allows variations in discs caused by humidity and temperature to be compensated for.

The ceramic gumball heads, one fixed and the other attached to an arm, are rounded to reduce wear and match the elasticity of the media.

ADAM... "Cost effective".

Inmos hires Newport chief

by Keith Holder
INMOS, has appointed Emery Wisman as director of manufacturing at its Newport factory. Wisman was won over from Texas Instruments, where he was manufacturing manager.

This will be the first time for nearly two years that the State-owned company has had a manager with chip-making experience — a situation brought about by the departure of Rex Meers.

During the interim period, the Newport operation has been run by Mike Wright, the company's director of corporate services.

Though coming from the US, this will not be Wisman's first job in this country. He was UK managing director for Texas Instruments before Robb Willmot, now managing director of ICL.

As the bulk of production is to

be transferred from the US, it is seen as important that someone with direct experience has his hand on the helm to ensure that this change is accomplished quickly and smoothly.

The need for a short timescale is most likely a function of the company's desire to expand its market penetration and the government's desire to denationalise.

Though Inmos has achieved a market share of over 70% for its specialist, high-speed storage chips, it also wants to establish itself in the high-speed 64K dynamic RAM market with the aim of moving quickly into profit.

This will have a direct bearing on the government's plans, as it has indicated it will dispose of its shares as soon as it is commercially practicable.

Inmos declined to comment.

Micro News is compiled by Robert Parry

Scotland could win another 1,000 jobs

by Nuala Moran
SCOTLAND looks like winning another microelectronics plant, creating 1,000 jobs. The £60 million factory is to be built by International Micro Electronics Products (IMP) of San Jose, California.

The Scottish Development Agency (SDA), the body which promotes industrial development in Scotland, has a £60,000 investment in IMP in the form of half a million preference shares. In exchange, the SDA got a commitment that if IMP expanded overseas it would come to Scotland.

One possible site for the plant is Livingston new town, which is situated to the West of Edinburgh. George Gray, managing director of IMP, has been reported as saying that he wants the factory to be in operation by 1986.

He said that if the European market develops according to plan the final investment will be around £60 million.

If the investment does reach £60 million, there will be 1,000 employees by the end of the 1980s or early 1990s. When the plant is first set up, it will employ about 300. A

firm decision on whether or not to go ahead with the development will be reached by March 1984.

IMP itself was only set up in 1981. Its turnover is currently running at around £13.4 million. It manufactures and designs integrated circuits, and the Scottish factory would be involved in wafer fabrication as well as engineering for customised chips.

Part of the attraction of Scotland, as far as IMP is concerned, are the research and development opportunities offered by the Scottish universities. And Gray himself already has experience of the Scottish electronics industry, having been in Scotland with a former employer.

A spokesman for the SDA explained that this was the first time it had made an investment of the IMP type, and that safeguards have been built in so that the SDA could get the money back if the factory did not materialise.

In fact, the SDA has made a good investment anyway, as the shares are now understood to be worth nearly three times more than it paid for them.

The Key Specialist Event in the Computer Year

Sponsored jointly by the Peripherals Suppliers Association and 'Systems International', Peripherals '84 has justifiably been named the *only* specialist show for computer professionals.

Through a massive publicity campaign using all the key systems development publications, Peripherals '84 will attract a record number of visitors from purchasing/specifier sectors of this continually expanding market. Attendance in 1983 was up 25 per cent on 1982. And 1984 is all set to be the biggest and most successful to date.

This is the buyer/specifier confrontation of the year. Don't miss it.

How to Book Your Stand

This is the key specialist event in the Computer Year — ACT NOW — for further information telephone Ian Hardman, Sales Manager on 01-661-3022.

PSA members are eligible for a preferential stand rate. If you are not already a member and would like to know more about the association's aims and objectives phone Mr Michael Perry on 0908 668118. Provided you become a member before the opening of Peripherals '84 you can claim the special members rate.

January 31 - February 2, 1984
Conrad Hotel, London

For more information return this coupon to Ian Hardman, Peripherals '84, Room L216, Quadrant House, The Quadrant, Sutton, Surrey SM2 5AS.

It's in the Year

MORTIMER, NIXON and LANDSLOWNE (left to right)... "Decided to have a go, because we saw there was such a gaping hole."

Trio to turn over £1 1/4m on home programs

by Nuala Moran
THREE women are building a software business on writing educational programs for home computers. Their programs are so successful that the high street home computer retailers are knocking at the door, and turnover is likely to reach £250,000 next year.

The company, Ampalsoft, is based in Cheshire. Although it has only been going for 12 months, it has already developed and is marketing a full range of programs called the Cheshire Cat Educational Series.

The company resulted from the joint brainwave of Patricia Lansdowne, Lynn Nixon and Ann Mortimer. Between them they have seven children aged from two

to eight years — and three Dragon 32 micros. The brainwave was not in recognising that there was a need for more educational programs for children, but in realising that between them and their husbands they had the expertise to make and sell such programs.

Patricia Lansdowne said: "We decided to have a go, because we saw there was such a gaping hole."

Ampalsoft was established last October and sold its first package in March. Lansdowne said: "If we continue to sell packages at the same rate as we have in the last two months, then we are heading for a £250,000 turnover in the year beginning this October."

The three founders started out with programs for their own

Dragons, and now have a series of programs ranging from learning how to use the Dragon, to a range of maths programs.

O-level programs for French, German and geography, and beginners' level physics, chemistry, computer science and general science will soon be available.

All testing and evaluation of the programs is done by the three founders who have worked full-time to build up the company. The programs were prepared by teachers of the subjects, who, according to Lansdowne, "got involved because they liked it."

About 40 people have so far been involved in preparing the programs, working on a part-time or consultancy basis. There are no full-time staff, apart from the

founders, but Lansdowne said they expected to take on a full-time programmer before Christmas.

At the moment the Cheshire Cat Educational Series runs only on the Dragon 32, but Oric and BBC micro compatible programs are on the way. There are plans to make the programs run on all major home computers.

Bolds is currently promoting the Dragon and has bought several thousand of the programs. Ampalsoft's products first went on sale in Curry's Micro Shops.

Lansdowne said: "We developed the packages and just sent them off to the major high street retailers to see what they thought." The company has also approached John Manley and Diana

COMPANY PROFILE

Microdata manages to resist the lure of the micro

ONE mini company in the UK is not going to sell a 16-bit micro in the face of falling markets for 16-bit units. And this is quite a distinctive feature in a market where even the largest companies have recently been lured into micros for just this reason - for example, Data General, General Automation and Honeywell.

Microdata managing director Jerry Causley, explained why the company felt able to resist the pull of the micro. "Microdata's UK market is the Times top 300 companies - large, sophisticated organisations. This type of user wants different things from the micro user."

"We are in the business of selling them large systems. These will embrace the PC in the sense of allowing them to hook on, but we don't need to go into the PC marketplace," he said.

The other trend that Microdata will not be following is the move towards selling through dealers. "As a manufacturer we will retain emphasis on end user selling and focus on the top end of the market," said Causley. "Other companies may vacillate between end user and distributor sales. My opinion is that selling through OEMs may bring quick profits, but it does not lead to strong relationships with the end user. If the distributor does a bad job it is the manufacturer that suffers."

Some 80% of Microdata's user base is lease/rental, and 20% outright sales which, Causley said, led to strong customer relations and provided financial strength.

Causley sees this policy of end user selling as still more important in the future. "People will want to control office automation closely. If we use OEMs then we won't be able to offer any guarantees because OEMs can back out."

But Microdata does not have a complete go-it-alone mentality. "We will work with software houses to cater for particular vertical markets, but we will still be the main contractor."

This philosophy seems to have borne fruit. The company, set up in 1970 as a US subsidiary, has always had a manufacturing base in the UK. "In fact," said Causley, "by Nuala Moran"

"in many cases Microdata products have a higher UK content than many people claiming to be totally UK."

"Now we have a ten-year track record in the UK. Our hardware is guaranteed for 10 years, and some that old is still in use."

Earlier this year Microdata announced record profits of £6.8 million, up from £1.8 million. Sales jumped 55% to reach £35 million. And, according to Causley, prospects for 1983 look good with deliveries of the Reality Series 8000 and the Sequon 32-bit super minicomputers up by over 50% and a 23% increase in orders to £13.5 million compared with the same quarter in 1982.

At the same time a £10 million investment in a research and development manufacturing plant which will create 300 jobs was announced.

The building is due for completion next May.

Causley identified several strands to Microdata's success. He is keen on what he refers to as "the people side of manufacturing."

"People have stayed with Microdata from the very beginning. The original management team that set up the company is still intact. And we've never had a dispute," he said.

Microdata was one of the first companies to promote the idea of worker directors. There are two in the company who attend board meetings. One is elected every six months, and they serve for 12 months.

"It is not a case of bringing complaints from the shop floor. The worker directors could not veto a decision, but they do become involved in decision-making. There have been occasions when they have come along asking for a pay rise but have decided with the board that it wouldn't be realistic to get one," said Causley.

This is one of the factors which he sees as contributing to Microdata's stable workforce. Another is that continued expansion since the firm was established has meant opportunities were always available. "We always plan future managers to come from within," said Causley.

Unlike other UK subsidiaries of US corporations, Microdata does R&D in the UK. Ten per cent of the profits each year are ploughed back into research.

"How do you survive against the might of an IBM or an ICL?"

CAUSLEY... Keen on "the people side of manufacturing".

Causley posed the rhetorical question. "The way is to look for niches where the giants aren't cost effective," he said.

Microdata has found niches in various vertical markets such as personnel, library systems and local authority applications.

Plenty of developments are in the pipeline, and new products on the way. Next year Supernatural is due to be launched. This is an artificial intelligence software which makes it possible to use a computer without special programming knowledge.

"This is the key to office automation," said Causley. "Anyone who hasn't got it won't be anywhere in that market. Artificial intelligence capability is the sign of whether or not a company will be viable in the next five years."

How does management contribute to a successful company like Microdata? "The most important asset to run a successful company is to be a good communicator. It's no good knowing where you are going if you don't tell people," said Causley.

"Of course I will have to work harder at communicating as Microdata grows. I have to make sure the message goes from top to bottom. It is failure to do this that is wrong with most large companies," he said.

PLATFORM

Why micro growth is a dilemma

THE micro industry has had a growth spurt. Hardware prices at the micro end of the market are on the verge of becoming obsolete by the time they are launched, so there is hardly time to establish a base before a machine is superseded by a faster, more powerful and, sometimes, cheaper model.

This leaves software developers in a perpetual quandary. Applications take time to reach the market and work cannot start until a programmer has the target hardware. By the time the machine is developed, a range of products, a micro's successor (which may be a different operating system or range of languages) is moving into production lines.

How to catch up and not flounder: that is the question.

As the micro market matures, the task of the software developer has altered dramatically. On the one hand, there is a high volume of low-priced products in an expanding market. On the other hand, as corporate buyers enter the market, customers demand higher knowledge and expertise than the quality of software has to be raised accordingly. It means higher development costs, which, to be viable, have to be recouped by selling to the widest possible range of customers.

If the nature of the customer changes, so does the degree of persistence likely to be placed on a computer system. Many buyers will rely on their system for years to come: a small business cannot afford the disruption of shifting its accounts to a new system every five years, and it probably won't be able to upgrade and build enhancement on its original software rather than change altogether.

Not only are developers expected to have learnt by now and other micro software house mistakes in the early days, they are also facing corporate buyers who can draw on the first-hand experience of in-house maintenance, mini-ITP departments.

The logical source to provide this capability is the original software developer and it is vital that this requirement can be effectively satisfied in the future. The selection of development tools has never been more critical.

It is becoming essential that hardware manufacturers should build for obsolescence, and provide the cohesion and portability needed to carry out a consistent growth path, regardless of the hardware.

Building up resources to offer this commitment for the future requires careful planning by the software house. When choosing target micro, operating system, language compilers and products, my tools - and, of course, the suppliers of each - the software developer must ask whether the products will be supported and enhanced for as long as they are likely to be needed, and beyond.

Paul Bailey is director of Engineering, Digital Research.

Telecomms policy confuses users

SIR Michael Edwards is not a man given to panic. He could be excused, however, if a twitch or two were to mar his urbane appearance.

Edwards, chairman of Mercury Communications Ltd, is in desperate need of customers for his rival to the British Telecom network. When he spoke this week at the annual Telecommunications Managers Association Conference in Brighton, he was given an effusive welcome by the chairman of the TMA. Edwards said thank you for the compliment, but I am here for the business.

The delegates to the TMA conference gave Edwards an enthusiastic welcome. They were clearly delighted by the response BT has made to the more competitive telecommunications environment, and they were clearly anxious that Mercury should succeed in its efforts to provide an alternative service.

But there was a marked reluctance by many of the telecommunications managers to put their own companies on the line for fear of getting embroiled in the arguments of BT's unions against the government sale of BT to the private sector.

Edwards lamented that the interconnection of Mercury to the BT network, and the sale of BT, are confused in many people's minds. He did not say, but he may have been implying that the government was once more getting hung up on its own doctrinaire approach towards selling off its assets.

Making the telecommunications market more liberal, and selling BT to the private sector, are two very separate issues, he suggests, and by tying them into the package the whole process is made subject to delay and possible failure.

The UK government has taken a lead in telecommunications policy which it expects the rest of the world to follow. But there is the danger that it has taken too large a bite in its attempt to let loose free market forces.

There is still a great deal of confusion about how the policy will work in practice, and users are not surprisingly taking a wait and see attitude.

Edwards promises that Mercury will establish itself as a major force in the telecommunications market. That is open to debate, but if the government wants the enterprise to succeed it should get in closer touch with the user community. A better mousetrap needs a convinced customer to sell.

Seminar of hot air

THE time of men like ICL's Wilmot, Ferranti's Alun Jones and Cable and Wireless's Sharp, does not, to put it mildly, come cheap. It is to be wondered whether they, and 250 other top industrialists, politicians, professors and bankers, feel that they spent Monday wisely.

Lancaster House probably drew together for the seminar on science, technology and industry a group of the richest and most successful people ever to meet under one roof in Britain. It is a pity they spent so much of the time recounting their own achievements.

If things were really that rosy there was no need for them to have come. There was a strange sense of unreality about it all, reinforced by the iteration of so many platitudes. There was also a sad dearth of definite proposals.

It was very late in the day when a representative of a minor venture capital house, Alan Patricof Associates, pointed the scale of the problem with the remark that one American company - IBM - spent more on research than the whole UK effort.

It was later still before the consensus on our academic brilliance was broken by Met Office director Sir John Mason, who feared we were in fact losing our sharp competitive edge in science.

Perhaps more of the real business of the day was being conducted over the lunch tables in the marquee.

Our first science-graduate PM called it a great success and promised a repeat. Next time she may not be able to say no-one declined to come.

1984 and all that . . .

THIS week's example of the strange things people say about computers was sent in by Trevor Warwick of Bromley, Kent, who writes:

New Order are using an Emulator programmable synth, which uses a "floppy" disc, which is a computer programme on a flat disc.

LETTERS

The things they say . . . BR on the wrong lines

IN your 1984 and all that . . . quote from *She* (Computer Weekly, September 1) an example of the strange things people say about computers, or is the choice of it an example of the strange attitude of computing people to the things people say about computers?

OK, so there are at least two sorts of loose expression in the extract; but given the cynical or at

least thoughtless way in which all too easily computer systems may be designed and used, any attempt to increase the awareness of the readers of *She* or any other popular magazine ought to be encouraged rather than patronised.

Bucks.

Let people do this work

IN Re-think on Jobs (Computer Weekly, September 1) you seem to fall into the trap of assuming "if not then leisure." This leaves out two major categories of work. Ironically there is more of it as yet than there are people available for work.

The need is an economic and social system that will let the people available do this work, whether as jobs in the cash economy, or outside the cash economy.

More leisure may come in the next century, but we should not take leisure now at the expense of the weak, nor of future generations.

Tops trainees 'half the cost of growing our own'

I READ with interest your article (Computer Weekly, July 28) on plans to revamp Tops computer courses. For a number of years I was responsible for programmer training and career developments in a management services organisation where we successfully "grew our own" programmers and analysts. More recently, I was instrumental in setting up a Tops programming course for a software house.

May I offer a few personal reflections on the Tops scheme in general and programming courses in particular?

I suspect that the most important obstacle to the employment of Tops "graduates" is the attitude of potential employers. Too many organisations, including the Civil Service I believe, are not prepared to take trainee programmers and analysts, and those that do prefer to train their own.

For too long there has been a Catch-22 situation whereby vacancies, with rare exceptions, call for a minimum of two years' experience. Not surprisingly, those organisations brave enough to advertise vacancies that provide this initial experience are deluged with replies.

We used to ask for at least two A levels and impose an upper age limit to reduce the flood to manageable levels. Even so, we used to receive about 150 replies.

Proper training is expensive, though using contractors to make up for shortfalls in permanent staff, or inflated salaries, are more so. We calculated that it cost the equivalent of a trainee's salary for a year simply to complete a thorough basic training lasting three months. But if a trainee stays only two years on average, as was our experience, it becomes difficult to justify such costs.

The recession may have encouraged programmers to remain longer with an individual employer. However, it is likely to have reduced employers' willingness to undertake training also, short-sighted though this may be in terms of investment in essential skills for the future. Not infrequently, training starts low on the list of management priorities, and is relegated even lower in times of crisis.

High employee mobility does not encourage this investment; but there is evidence indicating that turnover rates frequently fall when staff receive proper training, and conversely, lack of training can be

an important contributory factor in the decision to move on.

Tops trainees from properly run courses offer advantages to the employer. The cost and duration of training necessary to become fully productive are reduced, though not eliminated. Each trainee will need to be integrated into the organisation with its particular policies, methods and standards.

Some technical training may also be necessary. When we consider taking Tops-training programmers, we estimated the cost would be about half that of "growing our own".

Had we recruited Tops trainees, we would have insisted on the same entry procedures as applied to entrants without formal training. The reasons for doing this cost a critical light on some of the recommendations and expectations.

First, the combination of aptitude test battery, recommended by George Penney of the NCC, and interviews, had a proven track record within our organisation. From investigations we had carried out in the late 1970s, we were unimpressed by the selection procedures of certain organisations running Tops courses. I suggest that payment on a per capita basis introduced by the MSC in 1981 potentially worsened the situation as it does not encourage careful selection of students.

Second, our particular DP requirements led us to exclude both low and high achievers on the aptitude test battery. (Incidentally, we recruited computer science graduates infrequently for the same reasons.) Thus, the plan to use

the tables for two were unreserved. The single reserved seats were duly occupied and in due course groups of people wishing to sit together declined to do so as they could not sit together.

At restaurant car rates of about £10 per head, British Rail lost a significant amount of revenue because the left-hand does not know what the right hand is doing.

DOWNTIME

Sweet and reasonable

PERHAPS 1983 will go down in the political annals as the year of moderation. Margaret Thatcher returned to Number 10. And then the unthinkable: trade unionists are to talk to Norman Tebbit, although whether the much-altered Minister will reply remains to be seen.

In the computer industry too, moderation is in the air. When last year IBM announced its price rises, users howled with anger and conducted what was virtually a slanging match with IBM in public.

This year there are murmurs of discontent about a 10% increase in the cost of maintenance agreements on some machines. But there will be no public rift between IBM and members of the IBM Computer Users Association.

And in private users concede that IBM has judged things nicely to use the word in its original sense. Few users are saying they will be persuaded by the rise to go for the plug-compatible alternative.

Which cannot bode well for Apple, National Advanced Systems and others.

"Don't call our answering machine Mr Brewster. We'll call your answering machine."

Shome mishtake, m'lud

IT has not been Chad's practice to acknowledge the existence of any other organs that touch on our august industry, except when absolutely necessary - for instance, when they get sued - but there are special occasions which have an intrinsic value and therefore cannot be ignored.

It appears I have been quoted by E. Strobes, pp Lord Gnome, though I am sure there must be

Spare a thought for the operators

WHEN choosing a company name, it is as well to spare a thought for the British Telecom operators who will have to look it up in a directory. This thought clearly eluded the BBC's Brian Redhead when seeking a name under which to market his video, The Micro Computer.

He chose Double Tee Productions, a name which has caused many of our readers to cutse as a result of misspelling by staff of BT's directory enquiries.

"We received calls from some readers who had spent ages on the phone to director enquiries and who were beginning to think it was a hoax," says Trevor Taylor, producer of the video.

Matter of life and death

AN advertisement for a life assurance policy claimed that people in the UK could expect to die at 40 if they were born in the early days of Queen Victoria's reign. That is a statistic, a piece of useless information perhaps, but damnably correct.

However the advertisement went on to claim that men 140 years ago were less likely to live to see their grandchildren. Lie, damned lie or statistic? A damned lie I am afraid.

The fact is that the poor life expectancy was entirely down to infant deaths.

Not quite teacher's Pet

MY four-year-old daughter is already something of an addict to my little Pet, and one positive result is that she can spell as well as many a grown-up.

Not that that is a great recommendation - but not bad for a four-year-old.

Or so I thought until I received an obnoxious letter from her schoolteacher demanding to know why it was she could only read words that were written in capital, or upper case, letters.

Chad

10 YEARS AGO

FROM COMPUTER WEEKLY OF SEPTEMBER 13, 1973: Control Data Corp and NCR announced the joint formation of an advanced systems laboratory "to conduct joint architectural design of future central processing units". The 24th Slenb show in Paris attracted 579 exhibitors from 24 different countries. Digital Equipment Corp announced the first of a series of mini systems costing £10,800.

Graphics aid the war on cancer

A COMPUTER graphics system has been developed to help improve the drugs used in combating cancer. Thousands of cancer sufferers already owe their lives to drugs designed to attack the tumour cells without harming the remainder of the body.

But most of these drugs have dangerous side effects, partly because they are not specific enough and attack normal body cells as well. The problem is essentially a geometric one of insuring the molecules of the drug correspond in shape to the molecule of the cancer cell they are meant to attack. At present they have to be crudely shaped to the cancer cell and so interact to some extent with normal cells as well.

A computer graphics system to help scientists tackle this problem has been developed by Gresham, the Berkshire-based maker of graphics displays, and the Cancer Research Campaign Biomolecular Structure Research Group at King's College, London.

Programmer Suhail Islam helped write the software for the system at King's College.

"It's rather like looking at the shape of a lock and designing the key accordingly," he says.

The graphics display enables researchers to play around with the constituent atoms of two molecules on the screen. One of the molecules belongs to the cancer cell to be attacked, the other to the drug.

The idea is to arrive at a shape of drug molecule that fits the cancer molecule. The system helps to achieve this by rotating the molecules in a three-dimensional representation, and at the same time performs calculations of the energy released from the interaction between the molecules.

Obviously the research team had to rely solely on these energy calculations. Now they can arrive at a feasible structure on the screen, then make further refinements.

"It was very difficult before," admits Islam. "We are now beginning to predict the changes to the drug to make it more feasible."

IT chair for Stirling University

by Caroline Burgess
STIRLING University has followed the spirit of the government's Alvey proposals by creating a chair in information technology with the aim of helping industry.

First in the chair is Peter Henderson, a leading expert on the languages Lisp and Prolog, which are used for artificial intelligence applications and expected to figure in some of the fifth generation computer projects supported by Alvey money.

"We aim to establish a strong research department and to liaise with industry, find out its needs and respond to them," said Henderson.

"A university's primary duty is to train individuals but equally important is the need to run in industry to find out what the problems are and gear research to them."

To strengthen the UK information technology industry and to remain world class needs a lot of collaboration between universities and industry. A number of universities are expanding into computing and there is a definite change of emphasis.

"We are being guided by the government's Alvey proposals and luckily the research I want to do fits into those proposals. We are now seeking funding. Jointly executed research bringing together the two sides can make academics think more constructively."

Henderson is currently a lecturer in computing at Oxford University. He has also lectured at Newcastle University and worked as a visiting research scientist at the California Institute of Technology and at IBM.

His work has included the publishing of papers on software engineering and a textbook on functional programming. His previous research has mainly been in the areas of intelligent applications and the development of a version of Lisp programming language.

"There is a great deal of activity in Scotland which I am hoping to take part in," said Henderson. He is expecting to continue research into the application of functional programming while at Stirling.

Film School puts its faith in Cats

by Nuala Moran
FROM October the Royal College of Art's School of Film and Television will use a modular computer system to handle the organisation and administration of its TV and film production.

The computer-aided TV and film production system, Cats, was developed by Michael Raine, of the RCA, to run on Fortune microcomputers. The software modules implemented so far include script preparation and processing, production costing, budgeting and accounting, preparation of shooting schedules, costing, allocation and scheduling of equipment, and archive management.

Each year the RCA does 50 separate productions which represent a huge administration task. Using the Cats system will enable production staff to apply their specialist skills to being creative.

But Cats will not only appeal to large production companies. It runs on the Fortune single-user system recently introduced by Tera Data Systems, a Fortune distributor, which means it can be used for small production units.

EEC to extend language translation system

by John Riley
AFTER initial hostility, the Euro-Commission in Brussels is to follow the lead from the bureaucrats in Luxembourg and translate documents using the computerised language translation system Systran.

Systran is a bi-lingual translation system. Text is keyed in in one language via Wang text processors, translated by Systran which runs on an IBM 370 mainframe, and re-appears as a draft in the second language.

The system is currently used in Luxembourg but has been resisted by French translators in Brussels until now. The change in attitude results from a recent change in the administration.

"We translate about 600,000 pages a year in the Commission," said Leon Rolling, Luxembourg based head of transfer of informa-

Co-founder of Community Computer Camps Molly Lowell brings the joys of computing to children.

Computer camping is kids' stuff

THE joys of computer camps this year came to over 1,000 children from disadvantaged backgrounds in the London area. By the summer of 1983 children all over the country should have access to them, as the Inter-Action Trust sets about building a national network of 500 camps.

This year Inter-Action, a national charity, helped 14 youth clubs and community agencies, mostly in London, set up camps. Children of some families could come for a week for just £5, the cost of their lunches.

Weathered offspring had to pay up to £25, which is still considerably cheaper than commercial camps.

The commercial camps do offer other facilities like archery, swimming and gymnastics. But few kids in their right minds are interested in these when they can get their grubby hands on a micro.

Last month I visited the Inter-Action camp in London's Kentish Town, where this particular bandwagon started rolling last year.

The camp was just as well equipped as its commercial neighbours, with notices loaned by Atari, and other old bits of equipment, such as a robot arm programmed by a 13-year-old boy.

There was also some voice recognition equipment, useful for deaf children.

Nearly all the children were

girls. Just chance, said Molly Lowell, co-founder of Community Computer Camps, an advisory service set up by Inter-Action Trust.

At one of the other camps, said Lowell, nearly all the kids were black — the camps reflect local need.

Many of the children were writing computer programs in Basic for general knowledge quizzes — a good way, say the camp tutors, of introducing most of the language features without making them boring.

Even playing video games is not out of bounds — so long as the children write their own software.

The camp runs six weeks during

the summer, taking 36 children each week. The aim of the advisory service is to help other camps follow suit.

Lowell estimates that a small camp can be set up with a grant between £1,300 and £2,700, which will be provided jointly by the local authority and the Department of the Environment. But is based on the assumption that local authority provides the building, and some prevalent computer companies like Atari supply the computers.

Ed Berman, co-founder of the advisory service with Lowell, said he had talked with other camp makers, including Atari.

"Well, here's your refurbished kit."

Pregnant pause for ops

by John Riley
PREGNANT VDU operators working for Norwich Union can now opt for a transfer away from VDUs. That is the result of a recent agreement between Norwich Union and the Association of Scientific, Technical and Managerial Staffs (ASTMS).

But the two sides are not fully in agreement.

The union expects pregnant women to have the automatic right to transfer to other jobs, but the company, which uses about 600 VDUs in 36 locations, does not want it to be automatic.

"If a VDU operator wants a transfer during pregnancy, and where there is alternative work available, her supervisor will arrange this," said a Norwich Union spokesman, "but a transfer cannot

be guaranteed where there is no alternative work."

Peter Kennedy, an ASTMS national organizer, replied: "We thought they have that caveat, so we would respect the spirit of the agreement to be fully applied and that anyone who is pregnant would expect to be moved away from a VDU."

Kennedy said the union "is overruling" with a number of other companies, and it hopes to "turn these up" into agreements. He claims the agreement with Norwich Union is among the first in the UK.

"VDUs have not been found guilty of not guilty of causing miscarriages," he added, "but for the present we want to make sure our members have the benefit of the doubt."

PUZZLER

HERE is a giant chessboard, 11 x 11. The task is to place the Queens on the board in such a way that every one of the 121 squares is either occupied, or attacked by at least one of the Queens. (Put the benefit of the Queen, a chess Queen can move any number of squares in a straight line horizontally, vertically or diagonally.)

The second phase, due to start early in 1985 will involve commercial software houses, and several million pounds will be spent building the software and linguistic modules. The final phase will assemble the building blocks into a coherent prototype in 1987 and the completed translation system is scheduled to be available to industry by late 1988.

GRAPHICS

Why a good picture is worth more than a thousand words

David Casey explains the technical justification behind some of the recent developments in the graphics field

IF product announcements from computer manufacturers provide any indication, the ability to handle graphics is the current number one priority of the information processing industry. Working, perhaps, on the principle that a good picture is worth a thousand words, system designers are finding ways of integrating illustrations with data and text on computers.

Interest in graphics is not simply a marketing ploy on the part of the hardware suppliers to gain an edge over competition — there is a more technical justification behind recent developments. It is all a question of communication: psychological testing suggests that data presented in the form of graphs or piecharts can be absorbed more easily than as scribbled tanks of rows and columns.

Systems able to mould raw statistical information into a graphic display are not a new development. Like so many developments with applications in peace time, they evolve to meet a specific military requirement. Over in the US during the early 1950s, the Semi-Automatic Ground Environment (SAGE) air defence system employed a graphics quality VDU to mark the location of aircraft.

A graphics capability which could be applied to support business and technical software did not emerge for another decade, however. The Sketchpad project, financed by the US government at the Lincoln Labs of the Massachusetts Institute of Technology developed the concepts of data structure and software from which modern graphics systems have evolved.

Early graphics systems were inherently expensive: they required the largest — and most expensive — computers on the market at the time. The user base for the pioneering systems was therefore confined to government institutions, the major universities and industry. Applications of graphics technology had to justify the cost of the hardware and the development of software. Engineering design, with its implications for cost-saving, was therefore a natural candidate for computerisation through graphics.

Automated drafting systems were the first implementation of computer graphics in engineering: the software producing complex figures, with scaling and dimensioning, from libraries of prepared routines. The technology graduated into engineering design tools, with plane figures generated interactively from models developed through the keyboard.

Three-dimensional representation has been the major development for the engineering industry during the past four years; the software handling the changes in scale and perspective that are involved in presenting a 3-D concept through the medium of a 2-D screen.

By the mid-1960s, the cost of graphics system components had fallen to the point where computer manufacturers could risk developing systems for a more broadly based market.

Hewlett-Packard, for example, recognised the potential for a graphics system in the medical field; launching its first medical display in 1966. The forerunner of medical displays used as standard diagnostic tools today, the system found an immediate application in foetal monitoring. A high resolution radar display marked the company's entry into large screen display technology, providing the experience to design a commercial graphics terminal for data processing by 1978.

Manufacturers have taken up the challenge of computer graphics: many with applications that span the business and technical markets. Digital Equipment has recently launched its VAXstation system as a workstation to its 32-bit VAX super minis. Apart from emulating Tektronix and DEC's own VT100 terminals, the VAXstation allows engineering graphics programs to be run simultaneously with text and data

Manufacturers have taken up the challenge of computer graphics; many with applications that span the business and technical markets

the eye noticing the refresh. Raster scan technology has only recently become a viable display medium for the smaller systems market, given the cost of a screen required to support an acceptable standard of colour graphics. The screen is built up from minute pic-

resolution to 1,024 pixels in each direction, and the screen memory required is increased by a factor of four in half a megabyte.

Vector-refresh tubes are the third category. Operating in many ways like a storage tube in write-through mode, these systems do not hold an image on the phosphor. A typical graphics system based on this technology comprises a memory for the display, a display controller and a CRT.

The voltages required to control the tube are identified from a display list scanned by the display controller. The refresh rate required to avoid flicker is sufficiently slow for the image on the screen to be modified by the host computer. This ability to react rapidly to instructions input by an operator direct from the computer keyboard provides a suitable medium for CAD.

Graphics plotter development owes much to Calcomp, with its drum plotters, and the dry silver copier process of Tektronix. The technologies involved in generating an output correspond to the vector and raster methods of forming a screen image.

With a vector system, the output is developed by a pen moving from point to point across the writing surface. While the speed of such a device is usually high enough for business graphics applications, any reduction in throughput is more than compensated by the quality of the image.

Raster scan output devices perhaps more appropriate to multi-colour or shaded character resolution is lower than that of vector control. Images from a laser plotter are turned into copy in one of three ways. A striking through one, a coloured ribbon is an analogue matrix printer.

In practice, the current generation of matrix printers — in which the image is formed by successive passes of a comb of needles — produce an acceptable standard of graphics, merged with text data into a single document. A small printer set an image where a printing head comes into contact with heat sensitive paper, electrostatic printing is made on a photocopier.

Computer graphics seem to benefit from a printing technology which is only now emerging. Laser output devices can produce high resolution images from a display tube through a matrix photocopier, or by scanning a photographic film — a technology pioneered in the photo setting industry.

With 600 lines per inch resolution on a laser copier cost around £12,000, computer graphics will continue to spread areas of business and industry which would have been inaccessible to the US Defence Department just a generation ago.

At the level of a standalone device, the ICL Perq launched two years ago in the UK has found applications among both technical and commercial users. A similar market profile has been planned for the Apple Lisa; a product whose graphics potential perhaps exceeds the resources of the applications software now available.

References to computer graphics imply that a single technology underlies the display of illustrations on a VDU, or on the subsequence output to a printer. In practice, three parallel strands of development have produced displays which now satisfy the complete range of graphics requirements.

Storage tube systems retain an image without the need to refresh the display. Once a phosphor cell on the inner surface of the vacuum tube has been struck by an electron, it is activated; the intensity being maintained by a lower energy flood of electrons.

The writing beam draws what appears to be a continuous line in practice, a succession of short

ture elements (pixels), each of which is seen as a single point addressable by the computer when characters and graphic systems are being formed.

The number of pixels which are required to form a character determines the screen resolution. At a level of 512 by 512 pixels, more than a quarter of a million cells have to be identified uniquely — corresponding to about 32 Kbytes on an eight-bit computer.

Colour display monitors work in four planes, each requiring a similar amount of memory. The total memory consumed by such a screen — regarded only as a medium resolution device — is therefore 128 Kbytes. Double the

resolution to 1,024 pixels in each direction, and the screen memory required is increased by a factor of four in half a megabyte.

Vector-refresh tubes are the third category. Operating in many ways like a storage tube in write-through mode, these systems do not hold an image on the phosphor. A typical graphics system based on this technology comprises a memory for the display, a display controller and a CRT.

The voltages required to control the tube are identified from a display list scanned by the display controller. The refresh rate required to avoid flicker is sufficiently slow for the image on the screen to be modified by the host computer. This ability to react rapidly to instructions input by an operator direct from the computer keyboard provides a suitable medium for CAD.

Graphics plotter development owes much to Calcomp, with its drum plotters, and the dry silver copier process of Tektronix. The technologies involved in generating an output correspond to the vector and raster methods of forming a screen image.

Computer graphics seem to benefit from a printing technology which is only now emerging. Laser output devices can produce high resolution images from a display tube through a matrix photocopier, or by scanning a photographic film — a technology pioneered in the photo setting industry.

WORKPLACE

Graphics aid the war on cancer

A COMPUTER graphics system has been developed to help improve the drugs used in combating cancer. Thousands of cancer sufferers already owe their lives to drugs designed to attack the tumour cells without harming the remainder of the body.

But most of these drugs have dangerous side effects, partly because they are not specific enough and attack normal body cells as well.

The problem is essentially a geometric one of making the molecules of the drug correspond in shape to the molecule of the cancer cell they are meant to attack. At present they have to be crudely shaped to the cancer cell and so interact to some extent with normal cells as well.

A computer graphics system to help scientists tackle this problem has been developed by Gresham, the Berkshire-based maker of graphics displays, and the Cancer Research Campaign Biomolecular Structure Research Group at King's College, London.

Programmer Subnil Islam helped write the software for the system at King's College.

"It's rather like looking at the shape of a lock and designing the key accordingly," he says.

The graphics display enables researchers to play around with the constituent atoms of two molecules on the screen. One of the molecules belongs to the cancer cell to be attacked, the other to the drug.

The idea is to arrive at a shape of drug molecule that fits the cancer molecule. The system helps to achieve this by rotating the molecules in a three-dimensional representation, and at the same time performs calculations of the energy released from the interaction between the molecules.

Obviously the research team had to rely solely on these energy calculations. Now they can arrive at a feasible structure on the screen, then make further refinements.

"It was very difficult before," admits Islam. "We are now beginning to predict the changes to the drug to make it more feasible."

IT chair for Stirling University

by Carol Ann Burgess

STIRLING University has followed the spirit of the government's Alvey proposals by creating a chair in information technology with the aim of helping industry.

First in the chair is Peter Henderson, a leading expert on the languages Lisp and Prolog, which are used for artificial intelligence applications and expected to figure in some of the fifth generation computer projects supported by Alvey money.

"We aim to establish a strong research department and to liaise with industry, find out its needs and respond to them," said Henderson.

"A university's primary duty is to train individuals but equally important is the need to turn to industry to find out what the problems are and gear research to them."

"To strengthen the UK information technology industry and to remain world class needs a lot of collaboration between universities and industry. A number of universities are expanding into computing and there is a definite change of emphasis."

"We are being guided by the government's Alvey proposals and luckily the research I want to do fits into those proposals. We are now seeking funding. Jointly executed research bringing together the two sides can make academics think more constructively."

Henderson is currently a lecturer in computing at Oxford University. He has also lectured at Newcastle University and worked as a visiting research scientist at the California Institute of Technology and at IBM.

His work has included the publishing of papers on software engineering and a textbook on functional programming. His previous research has mainly been in the areas of intelligent applications and the development of a version of Lisp programming language.

"There is a great deal of activity in Scotland which I am hoping to take part in," said Henderson. He is expecting to continue research into the application of functional programming while at Stirling.

Film School puts its faith in Cats

by Nicola Moran

FROM October the Royal College of Art's School of Film and Television will use a modular computer system to handle the organisation and administration of its TV and film production.

The computer-aided TV and film production system, Cats, was developed by Michael Raine, of the RCA, to run on Fortune microcomputers. The software modules implemented so far include script preparation and processing, production costing, budgeting and accounting, preparation of shooting schedules, costing, allocation and scheduling of equipment, and archive management.

Each year the RCA does 50 separate productions which represent a huge administration task. Using the Cats system will enable production staff to apply their specialist skills to being creative.

But Cats will not only appeal to large production companies. It runs on the Fortune single-user system recently introduced by Telen Data Systems, a Fortune distributor, which means it can be used for small production units.

"We are being guided by the government's Alvey proposals and luckily the research I want to do fits into those proposals. We are now seeking funding. Jointly executed research bringing together the two sides can make academics think more constructively."

Henderson is currently a lecturer in computing at Oxford University. He has also lectured at Newcastle University and worked as a visiting research scientist at the California Institute of Technology and at IBM.

His work has included the publishing of papers on software engineering and a textbook on functional programming. His previous research has mainly been in the areas of intelligent applications and the development of a version of Lisp programming language.

"There is a great deal of activity in Scotland which I am hoping to take part in," said Henderson. He is expecting to continue research into the application of functional programming while at Stirling.

Co-founder of Community Computer Camps Molly Lowell brings the joys of computing to children.

Computer camping is kids' stuff

THE joys of computer camps this year came to over 1,000 children from disadvantaged backgrounds in the London area. By the summer of 1985 children all over the country should have access to them, as the Inter-Action Trust sets about building a national network of 500 camps.

This year Inter-Action, a national charity, helped 14 youth clubs and community agencies, mostly in London, set up camps. Children of some families could come for a week for just £5, the cost of their lunches.

Wealthier offspring had to pay up to £25, which is still considerably cheaper than commercial camps.

The commercial camps do offer other facilities like archery, swimming and gymnastics. But few kids in their right minds are interested in these when they can get their grubby hands on a micro.

Last month I visited the Inter-Action camp in London's Kenning Town, where this particular bandwagon started rolling last year.

The camp was just as well equipped as its commercial neighbours, with micros loaned by Atari, and other odd bits of equipment, such as a robot arm programmed by a 13-year-old boy.

There was also some voice recognition equipment, useful for deaf children.

Nearly all the children were

girls. Just chance, said Molly Lowell, co-founder of Community Computer Camps, an advisory service set up by Inter-Action Trust.

At one of the other camps, said Lowell, nearly all the kids were black — the camps reflect local need.

Many of the children were writing computer programs in Basic for general knowledge quizzes — a good way, say the camp tutors, of introducing most of the language features without making them boring.

Even playing video games is not out of bounds — so long as the children write their own software. The camp ran six weeks during

the summer, taking 36 children each week. The aim of the advisory service is to help other camps follow suit.

Lowell estimates that a six-week camp can be set up with a grant of between £1,400 and £2,700, which will be provided jointly by the local authority and the Department of the Environment. This is based on the assumption that the local authority provides the building, and some provision of computer equipment like Atari supplies the computers.

Ed Bennett, co-founder of the advisory service with Lowell, said he had talked with other micro makers, including Atari.

Pregnant pause for ops

by John Riley

PREGNANT VDU operators working for Nurelton Union can now opt for a transfer away from VDUs. That is the result of a recent agreement between Nurelton Union and the Association of Scientific, Technical and Managerial Staffs (ASTMS).

But the two sides are not fully in agreement.

The union expects pregnant women to have the automatic right to transfer to other jobs, but the company, which uses about 600 VDUs in 36 locations, does not want to be automatic.

"If a VDU operator wants a transfer during pregnancy, and where there is alternative work available, her supervisor will arrange this," said a Nurelton Union spokesman, "but a transfer cannot

be guaranteed where there is no alternative work."

Peter Kennedy, an ASTMS national organiser, replied: "Although they have that caveat, we would expect the spirit of the agreement to be fully applied and that anyone who is pregnant would expect to be moved away from a VDU."

Kennedy said the union "has understood" with a number of other companies, and it hopes to "firm these up" into agreements. He claims the agreement with Nurelton Union is among the first in the UK.

"VDUs have not been found guilty of not quality of causing miscarriages," he added, "but for the present we want to make sure our members have the benefit of the doubt."

EEC to extend language translation system

by John Riley

AFTER initial hostility, the Euro-administration in Brussels is to follow the lead from the bureaucrats in Luxembourg and translate documents using the computerised language translation system Systran.

Systran is a bi-lingual translation system. Text is keyed in in one language via a word processing processor, translated by Systran which runs on an IBM 370 mainframe, and re-appears as a draft in the second language.

The system is currently used in Luxembourg but has been resisted by French translators in Brussels until now. The change in attitude results from a recent change in the administration.

We translate about 600,000 pages a year in the Commission," said Leon Rolland, Luxembourg-based head of transfer of information

between European languages for the Commission, "and about 197% is computer translated. The proportion is higher when you look at certain language sets."

At present the machine-produced drafts need editing. "For a flowery political speech about 25% of the text needs tidying up," explained Rolland. "But only about 8-10% of scientific texts need tidying."

"We take this with a great pinch of salt," he put it mildly, "said Geoffrey Bowker, secretary of the London-based Association of Translation Companies last week. "By the time you've keyed it in and got back the gobbledegook it translates could have done it straight off."

The Association of Translation Companies wants to see computers to distribute the translation work around Europe via modems and not to use computers for the actual

translation. Recently it demonstrated its method to Euro MPs using CPT (UK) word and linguistic processors. The pages to be translated were first to remote translators, who translated them directly via word processors on to disc. These were then transferred via modems on to discs elsewhere.

Rowland believes by farming work out to private companies the Commission can save £200 million a year.

In the meantime, the European Commission's £16.67 million 5% R&D programme Europa, is approved last November after an 18-month delay, and aims at producing a working multi-lingual translation system that will translate any combination of

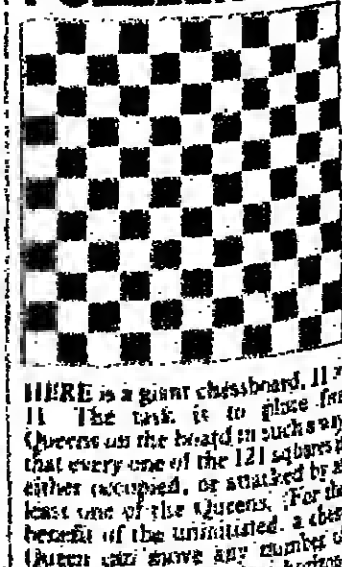

European languages. Eurotran will be a significant advance over Systran which is a bi-lingual system bought in from the World Translation Centre of La Jolla in California.

The first, planning phase, started earlier this year and is being carried out in European universities. British universities involved are UMIST, Cambridge and Essex.

The second phase, due to start early in 1985 will involve commercial software houses, and several million pounds will be spent building the software and linguistic modules. The final phase will assemble the building blocks into a coherent prototype in 1987 and the completed translation system is scheduled to be available to industry by late 1988.

GRAPHICS

Why a good picture is worth more than a thousand words

David Casey explains the technical justification behind some of the recent developments in the graphics field

IF product announcements from computer manufacturers provide any indication, the ability to handle graphics is the current number one priority of the information processing industry. Working, perhaps, on the principle that a good picture is worth a thousand words, system designers are finding ways of integrating illustrations with data and text on computers.

Interest in graphics is not simply a marketing ploy on the part of the hardware suppliers to gain an edge over competition — there is a more technical justification behind recent developments. It is all a question of communication: psychological testing suggests that data presented in the form of graphs or piecharts can be absorbed more easily than as scribbled ranks of rows and columns.

Systems able to mould raw statistical information into a graphic display are not a new development. Like so many developments with applications in peace time, they evolve to meet a specific military requirement. Over in the US during the early 1950s, the Semi-Automatic Ground Environment (SAGE) air defence system employed a graphics quality VDU to mark the location of aircraft.

A graphics capability which could be applied to support business and technical software did not emerge for another decade, however. The Sketchpad project, financed by the US government at the Lincoln Labs of the Massachusetts Institute of Technology developed the concepts of data structure and software from which modern graphics systems have evolved.

Early graphics systems were inherently expensive: they required the largest — and most expensive — computers on the market at the time. The user base for the pioneering systems was therefore confined to government institutions, the major universities and industry. Applications of graphics technology had to justify the cost of the hardware and the development of software. Engineering design, with its implications for cost-saving, was therefore a natural candidate for computerisation through graphics.

Automated drafting systems were the first implementation of computer graphics in engineering: the software producing complex figures, with scaling and dimensioning, from libraries of prepared routines. The technology graduated into engineering design tools with plane figures generated interactively from models developed through the keyboard.

Three-dimensional representation has been the major development for the engineering industry during the past four years; the software handling the changes in scale and perspective that are involved in presenting a 3-D concept through the medium of a 2-D screen.

By the mid 1960s, the cost of

graphics system components had fallen to the point where computer manufacturers could risk developing systems for a more broadly based market.

Hewlett-Packard, for example, recognised the potential for a graphics system in the medical field; launching its first medical display in 1966. The forerunner of medical displays used as standard diagnostic tools today, the system found an immediate application in foetal monitoring. A high resolution radar display marked the company's entry into large screen display technology, providing the experience to design a commercial graphics terminal for data processing by 1978.

Manufacturers have taken up the challenge of computer graphics: many with applications that span the business and technical markets. Digital Equipment has recently launched its VAXstation system as a workstation to its 32-bit VAX super minis. Apart from emulating Tektronix and DEC's own VT100 terminals, the VAXstation allows engineering graphics programs to be run simultaneously with text and data

Manufacturers have taken up the challenge of computer graphics; many with applications that span the business and technical markets

processing routines in virtual memory. Windows through the high resolution screen select the working areas to be viewed, and these are pasted together on the display.

At the level of a standalone device, the ICL Perq launched two years ago in the UK has found applications among both technical and commercial users. A similar market profile has been planned for the Apple Lisa; a product whose graphics potential perhaps exceeds the resources of the applications software now available.

References to computer graphics imply that a single technology underlies the display of illustrations on a VDU, or on the subsequent output to a printer. In practice, three parallel strands of development have produced displays which now satisfy the complete range of graphics requirements.

Storage tube systems retain an image without the need to refresh the display. Once a phosphor cell on the inner surface of the vacuum tube has been struck by a lower energy flow of electrons.

The writing beam draws what appears to be a continuous line — in practice, a succession of short

vectors — between pairs of points on the screen. The effect of a solid line is achieved by focusing the light beam to a diameter marginally greater than the spacing between the phosphor cells.

Terminals incorporating storage tubes are characterised by the sharp edges to the image and the absence of flicker on the display. A complete display can be re-written in less than half a second, making storage systems suitable for computer-aided design and drafting, where changes to a design can be made interactively. The ability to fill in areas of the display between defined boundaries extends the application from engineering into cartography.

A refreshed image can be superimposed on an image being stored on the screen, using the write-through facility. The intensity of the beam is maintained at a level low enough to avoid tripping the phosphor cells and switching on the flood beam. In this mode, it is possible to construct complex graphics modules which can be edited and re-positioned before storage.

The raster-scan technology used by television displays has been taken up by computer graphics designers as the second of the methods for creating an image. A modulated electron beam is scanned uniformly across the surface of the CRT at 50 or 60 hertz — a rate high enough to prevent

the eye noticing the refresh. Raster scan technology has only recently become a viable display medium for the smaller systems market, given the cost of a screen required to support an acceptable standard of colour graphics. The screen is built up from minute pic-

Graphics plotter development owes much to Calcomp, with its drum plotters, and the dry silver copier process of Tektronix

ture elements (pixels), each of which is seen as a single point addressable by the computer when characters and graphic systems are being formed.

The number of pixels which are required to form a character determines the screen resolution. At a level of 512 by 512 pixels, more than a quarter of a million cells have to be identified uniquely — corresponding to about 32 Kbytes on an eight-bit computer.

Colour display monitors work in four planes, each requiring a similar amount of memory. The total memory consumed by such a screen — regarded only as a medium resolution device — is therefore 128 Kbytes. Double the

resolution to 1,024 pixels in each direction, and the screen memory required is increased by a factor of four to half a megabyte.

Vector-refresh tubes are the third category. Operating in many ways like a storage tube in write-through mode, these systems do not hold an image on the phosphor. A typical graphics system based on this technology comprises a memory for the display, a display controller and a CRT.

The voltages required to control the tube are identified from a display list scanned by the display controller. This ability to react rapidly to instructions input by an operator direct from the computer keyboard provides a suitable medium for CAD.

Graphics plotter development owes much to Calcomp, with its drum plotters, and the dry silver copier process of Tektronix. The technologies involved in generating an output correspond to the vector and raster methods of forming a screen image.

With a vector system, the output is developed by a pen moving from point to point across the writing surface. While the speed of such a device is usually high enough for business graphics applications, any reduction in throughput is more than compensated by the quality of the image.

Raster scan output devices are perhaps more appropriate for multi-colour or shaded charts, but the resolution is lower than under vector control. Images from a raster plotter are turned into hard-copy in one of three ways. A head striking through one or more coloured ribbons is analogous to a matrix printer.

In practice, the current generation of matrix printers — in which the image is formed by successive passes of a comb of needles — can produce an acceptable standard of graphics, merged with text and data into a single document. Thermal printers set an image when the printing head comes into contact with heat sensitive paper, while electrostatic printing is modelled on a photocopy.

Computer graphics seem set to benefit from a printing technology which is only now emerging. Laser output devices can reproduce high resolution images from a display tube through a modified photocopy, or by scanning directly to a photographic film — a technology pioneered in the phototype-setting industry.

With 600 lines per inch resolution on a laser copier costing around £12,000, computer graphics will continue to spread into areas of business and industry which would have been inconceivable to the US Defence Department just a generation ago.

Animation is coming to the steam age

John Charlton looks at some cartoon Antics

If animation addict Alan Kitching has his way, cartoon creators the world over will soon be drawing images via a computer keyboard. Kitching is the driving force behind Antics, a software package for producing animated images through a combination of a drawing board, a minicomputer, three screens and an image recorder.

So far Antics has been taken on board by Nippon Univac, which found Kitching's system to be far in advance of any other available animation system.

So impressed was Sperry's Japanese subsidiary that it bought the rights to distribute the system in Japan. This finance enabled Kitching and his colleagues to spend a year in Tokyo improving the software.

But the genesis of Antics was not simply a year in the land of the rising sun. It is a project to which Kitching has devoted the best part of 10 years.

After studying architecture in the refined air of Cambridge, Kitching moved to London where he began to complement his interest in animation with a growing

knowledge of computers. He first dipped his toe into the ever burgeoning seas of computing at Univac, in the peace and love year of 1967.

Kitching's road to Dniascus experience came to Vienna in 1971 when he saw his first examples of computer animation. Although he thought that these examples were "quite useless for practical animation purposes", he saw the potential for development.

But it was at the Royal College of Art (RCA), in 1972, that Kitching produced his first computer animation work. This consisted of the title sequence for a commercial film, for the British Film Institute, *Dream of Arthur Sleep*. During his time at the RCA Kitching met his future collaborator, fellow animator Jim Harker.

But the man who pushed Kitching in the direction of computerised animation was RCA computer artist Colin Emmett.

Emmett had already experimented with computer animation at the Atlas Computer Laboratory in Oxford. The aforementioned "astronaut" title sequence for the BFI film was the immediate fruit

of Kitching's partnership with Emmett. More importantly, Kitching was persuaded by Emmett to learn Fortran, and to develop his ideas on computer animation at the Atlas Laboratory.

From 1973 to 1975, using a DEC minicomputer, Kitching laboured at the Atlas lab and produced the first Antics package. Kitching calls this stage the "preliminary version of Antics-Animate".

But it was at the Royal College of Art (RCA), in 1972, that Kitching produced his first computer animation work. This consisted of the title sequence for a commercial film, for the British Film Institute, *Dream of Arthur Sleep*. What Antics can do - above and below.

exciting developments lay ahead.

A demonstration at Ingmar Bergman's alma mater, the prestigious Swedish Film Institute, led to Swedish Television showing an interest in Antics. By now Kitching had set up an independent company with Harker, Grove Park Studio Animations, for the express purpose of developing Antics.

Between 1976 and 1978 the duo worked on what they called the "paleolithic" (stone age) version of Antics. These activities took place in Stockholm, and the two computer animators used a Univac 1100 mainframe. Under the auspices of Grove Park Studios they tried to raise capital for the funding of further work on Antics.

This produced almost no response. After a short spell in England Kitching returned once more to Stockholm and used the computer animation package to produce cartoons for the 1979 Swedish general election.

Kitching says: "In the 1979 election broadcast we produced caricatures of the five party leaders, which we turned into an animated swingometer. As the swing went up and down, so the grins turned into frowns."

"All in all it was a clear demonstration of the productive potential of Antics. Yet we were still using the same machine that did all the studio's administrative work, so as soon as we started drawing the whole organisation came grinding to a halt. We needed full commercial backing for better hardware."

While visiting Nippon Univac in Tokyo Kitching demonstrated the Antics animation which had been produced in Sweden. It seems that the Japanese company had looked in the US for computer animation equipment good enough to satisfy the needs of interested customers in television and the Japanese film industry. In return for exclusive rights to sell Antics in Japan, Nippon Univac provided the money and the facilities

for yet further development of the "paleolithic age" Antics package.

Kitching says: "Three of us, myself, Jim Harker and a girl who spoke Japanese worked full time in Tokyo during 1981 and 1982."

"There we devised one big Fortran program which consists of about 1,600 routines. The average routine is of the order of 50 to 60 lines. The main problem was getting the hardware performance just right. A real time full colour system would have been desirable. We used a DEC Vax, which was adequate for commercial purposes."

The version of Antics perfected during the time spent in Tokyo is now on commercial sale. Kitching says: "The software will sell for about £15,000 in Europe."

"We started putting the word out in May and everybody's interested, especially video, television and film companies. Unfortunately many of the interested potential customers don't have the right kind of hardware, which is quite a big investment."

"But universities, polytechnics, colleges and the like should be a good market, as many already have the right sort of hardware."

In order to run "steam age" Antics a 32-bit processor is almost essential, as is a virtual memory system. So far it has been implemented under Vax/VMS and Pave/Prime. Storage required to run the software amounts to a minimum two Mbytes of central core, but half an Mbyte may suffice if performance speed is not critical.

Grove Park Studios claims that the Antics software is device independent, as all program I/O instructions are handled by a group of back end routines. The minimum disc storage recommended is 80 Mbytes of high speed access.

Other hardware needed is a real screen - any simple VDU will do - a line test screen, a colour screen, a drawing board, a raster board and a hardcopy unit.

The line test screen should be capable of displaying at least 100,000 vectors, and must have good alphanumeric test facilities. A minimum baud speed of 100K is recommended.

As for the colour screen, it must have a minimum of six bits per pixel. Each pixel must be individually addressable and all pixels should be capable of showing a unique colour. This will give availability of a quarter of a million colours at one time. Although the program can work with less.

Kitching believes that for the sake of accuracy a large drawing board is necessary, and an inflexible stylus pen.

Various devices are recommended for the recorder. The cheapest is a conventional video camera recording directly from the screen under computer control. Alternatively small automatic units like those produced by Matrix or Calcomp will suffice. Video tape recorders may be used but these may require a custom-built computer control unit.

Now that Kitching and his Grove Park Studio company, which is located in Caterham, South London, has taken Antics through the Preliminary Age and the Paleolithic Age, he says that the next step is the Steam Age.

To help him further this work Kitching is looking for some business programmers. They must have an excellent knowledge of Fortran, and also be interested in animation.

CAD does much more than automate the drawing office

Robert Fenner believes CAD/CAM should arrive at a single continuous design and construction process

CAD/CAM (computer aided design/computer aided manufacture) is a wedding of two distinct processes. An object is drawn and the data which accrues from that process is directly employed in its manufacture. It is not simply about drawing or even designing.

Some CAD companies claim that for them CAD stands, not for computer aided design, but for computer aided draughting. Don't be fooled. The aim of CAD/CAM is to arrive at a single, continuous design and construction process. It is not to do little more than to automate the drawing office.

CAD/CAM in its fullest sense needs a large, minicomputer based system to apply it. Smaller systems tend to be sophisticated drawing tools which go some way towards supplying the information needed for the manufacturing process. What they have in common is a screen. This can take two forms.

The first kind is DVST (direct view storage tube graphics). A "writing gun" similar in principle to the cathode ray tube in a standard television set creates charge patterns on a luminescent screen. DVST graphics require a high voltage refresh rate to maintain the image on the screen; they also suffer from what is almost the opposite problem. When a screen is reconfigured a line previously drawn on it sometimes takes a long while to fade. This is known as "ghosting". An advantage is that straight lines are represented clearly and sharply.

The second, and nowadays more common kind of display, is the raster graphic device. With this method the screen, rather than being coated with a single uniform luminescent layer, is instead composed of thousands of "picture elements" or "pixels". On a monochrome raster graphics screen each pixel has a bit of RAM memory allocated to it: whether the bit is a "0" or a "1" will determine whether or not the pixel is live and part of the display.

In the early days the resolution of such screens was poor. Insufficient numbers of pixels meant that, say, a diagonal line or curve drawn on the screen would have "steps" in it. Nowadays, largely due to the falling price of RAM memory, the resolution of the raster screen is greatly improved.

A further result of the increasing cheapness of memory, and one that has led to the widespread adoption of raster technology by CAD system manufacturers, is that it affords the user a huge palette of colours. Different planes of memory in the system are assigned to different colours in the spectrum, each plane having a bit assigned to each pixel.

The combinations of bits in different planes produces the pixel's colour. Some of the larger CAD/CAM systems available are able to reproduce over 16 million shades of colour on one screen and at the same time.

Another feature which all CAD and CAD/CAM systems have in common is, naturally enough, a means of communicating with the image on the screen. The screen cursor may be controlled in a number of ways. One is the terminal keyboard. Others are devices you might find on video games in an arcade: joysticks, trackballs and thumbwheels. There are also light pens, which digitise an area of the screen when pressed against it; and there are digitising tablets.

Digitising tablets are coated fine meshes of wire laid out in tight grids on a table placed alongside the keyboard on the desktop. A

cursor controller or "mouse" with a fine crosshair is passed across its surface; the cursor's position and the command given to it are activated when a button on the mouse is pressed. Digitisers, like raster screens, nowadays have a very high resolution. Some of them are accurate to within a millimetre or less.

CAD/CAM software's two best known aspects are the parts at either end of it. There is the design software, with facilities for either 2-D or 3-D representation on the screen; and there are the numerical control programs which convert the digitised data constructed from the design into commands recognisable by machine tools.

Here, too, there are buzz-words. Those prevalent at the moment are largely concerned with standards for design software. They are CORE and GKS.

CORE is a proposal for a 3-D design standard. The package was developed by ACM Siggaph in the United States in the late seventies and submitted to the International Standards Organisation for approval. In November last year ISO rejected the proposal; CORE, it has been suggested, which outlined parameters for the definition of screen variables and of surface and solid modelling, was too rigid to admit some of the changes that would be demanded of it by movements in the graphics market.

However, it was widely adopted at the time - minicomputer CAD/CAM companies such as

A result of cheap memories is that it affords the user a huge palette of colours

DEC had announced their intention to support it - and the American National Standards Institute is said to be revising it.

The idea of GKS, a 2-D proposal published as a draft international standard by ISO this summer, is that the user's application is isolated from the hardware while optimising its use. Thus the user may draft designs on a cluster of workstations - including combinations of DVST and raster screens - and still be able to transport his design from one machine to another.

DVST machines are enhanced, for example, by switch options which save power by only updating the screen when changes are made on it, while raster systems are conversely allowed to handle more of the display work in hardware. The user of CAD/CAM is not necessarily well versed in computer terms, and the idea of GKS and of most application pack-

ages, for that matter, is that they should cause as little inconvenience as possible.

Ease of use is one of the driving forces behind CAD/CAM. It is what gave rise to its most important recent development - the software bridging design and numerical control which allows a product design to be implemented more quickly.

Finite element modelling, as it is called, arose from solid modelling packages such as Shape Data's Romulus, CIS's Medusa and Pafec's Boxer. These packages "visualise" a solid object for the user on the screen but also provide information on the relationships between the object's various coordinate points and sides.

This type of information in the raw data of the numerical control program; the designer no longer has to re-key all the data which accrued from his original work. With the design still on the screen, he can check it for logical inaccuracies, expose it to simulated stress and even run it through a simulated machining stage to check the cutting paths of the tools which produce it.

He can then generate a finite element mesh and send its coordinates to the numerical control application in a very short time indeed - on Romulus, for example, such an operation during the production of a racing car engine part took only 10 seconds. He can also, incidentally, with other application packages standard to most software suites, obtain such information as a bill of materials for costing purposes.

The possibilities afforded by this kind of power are enormous. A design, test and production cycle can be worked through to its end from one office, supervised by one team. With interactive devices that are simple to use, and menu-driven commands that are simple to learn, the architect, PCB designer or mechanical engineer can concentrate on the job for which he was trained.

CAD/CAM is his tool, not the bane of his life. He can even decide how he wants to use it: on Applecon's system, for example, he can designate his own instructions. A circle around an object could be made, say, to indicate a "zoom in". Every time a circle is drawn and the cursor released, the command would be automatically initiated. This kind of facility automates the drawing office; but also, with access to the rest of the manufacturing schedule, the office provides a single centre of information.

Systems which provide the accuracy and continuity of what is now called "true CAD/CAM" are available from the mini CAD/CAM companies and their software suppliers.

CAD/CAM is a tool - not the bane of an engineers' life.

UNIX and 'C' Courses

Bleasdale Computer Systems, the UNIX Systems Company, offers the following courses which are presented by leading European UNIX experts.

The UNIX management overview covers the development and features of UNIX, its applications in areas such as networking, and office automation.

The technical workshops are highly practical, with each course attendee having their own terminal for practical work.

UNIX - Management Overview	22nd Sept 1983
1 day	£150
10th Nov 1983	
UNIX - Workshop	12-13 Sept 1983
2 days	£225
26-27 Sept 1983	
10-11 Oct 1983	
C - Workshop	14-16 Sept 1983
3 days	£285
28-30 Sept 1983	
12-14 Oct 1983	
C - Advanced Workshop	19-20 Sept 1983
2 days	£225
31 Oct-1 Nov 83

A typical example of CAD.

Meltek THE NEW NAME FOR COMPUTER ESSENTIALS

Until someone comes up with the everlasting disc head, or an air filter that never needs replacing, Meltek Data will continue to supply these essential components quickly and efficiently. We carry new replacement filters and heads for almost every make of disc drive and we operate what is probably the most efficient disc head exchange and refurbishing service in the industry. We also stock a wide range of quality recording media, and we invariably offer immediate delivery for most items on our extensive inventory. We've made our name through strong product knowledge and a genuine understanding of customer needs.

Paper gobbling printers and plotters complete the picture

Mike Sawyer charts What's What in the market for printers and plotters

WHATEVER happened to the promise made by the infant computer industry that the paperless office was just around the corner?

Paper gobbling printers and plotters are an integral part of all computer systems. They produce highly readable copy, are a useful backup system for the sometimes unreliable electronic storage media and provide the easiest means of communicating computer output - especially in a business environment.

No office undertaking computer aided design (CAD) would be complete without its graphics plotter to draw up designs which can now be accurate to 1,000th of an inch.

Similarly, no business office would be complete without a printer of sorts to handle data processing, word processing and the occasional graphics.

Indeed, the fact that graphics options are offered on computer hardware by manufacturers is often a major selling point to the computer user and potential buyer.

The spread in use of computer generated graphics has helped to coin the phrase 'visual management' - summing up the notion that a picture is worth a thousand words.

The most common and popular form of graphics printer is the dot matrix kind.

Matrix printers work on the principle of constructing letters or characters by using matrices of dots. The print head consists of a set of pins, each of which can be fired at an inked ribbon to form the character required.

Plotters, on the other hand, use pens controlled by an arm which pushes the pen in the direction required.

There are two types of graphics plotter. One is the drum version, in which the pen moves only in the horizontal direction - the X direction. Vertical lines, the Y direction, are achieved by rotating the drum on which the paper is held.

The other type of plotter is the flat bed plotter, which as the name indicates, holds the paper or drawing material on a flat work surface. The plotter's arm then moves the pen across the paper in both the X and Y directions.

Matrix printers are capable of producing high quality, graphic output with the added advantage of producing printed text as well.

And matrix printers are usually the more popular version for the average business user for those reasons. As their quality improves the matrix printers will probably supersede the dedicated graphics plotter in the business user market.

Plotters are slower in producing output than matrix printers and are usually more expensive, but offer more accurate and much higher resolution graphics.

When buying a hard copy graphics output device this first consideration must be the use to which it will be put.

If it is only for the occasional bar chart, piechart or line drawing for example, where very high accuracy is not required then the matrix printer will do.

Many matrix printers come with colour printing capability but it is only towards the top end of the range that the variety of colours available matches that of plotters. Printers at the low end of the market usually offer either black/white or only two or three colours.

Plotters are usually sold with fibre tip or liquid ink pens which

offer a virtually unlimited range of colours.

If your interest is computer aided design, necessarily using a plotter for accuracy, it may be useful to point out that a recent survey found the most popular choice of pen for plotters was the good old ball pen. It is proven, cheap and very hard to damage. Next most popular but a long way behind the ball pen was the roller ball type pen, followed by liquid ink pens and finally the fibre tip pen.

A quick glance at the printer market shows that around half the daisywheel letter quality printers on the market come with graphics potential. Also, two thirds of printers sold have graphics as standard and all matrix printers offering a wide range of colours are adapted for graphics.

Prices for the matrix printers can range from as little as £80 - the price of the Amber 2400 matrix printer supplied by Lethaby Numbering of Andover.

The Amber has a low quality print suitable for home computer users and has a maximum print speed of 15 characters per second and prints on 5.8 cm wide paper.

At the other end of the scale is the £4,590 Trilog T-300 supplied by Datatrade of Northampton. This matrix has a maximum print speed of 400 characters per second and prints on paper 16 inches wide. With both serial and parallel interfaces the Trilog can be used with the most popular business computers.

In between these two extreme examples lies the heart of the matrix printer market.

The British Army used to have a saying - the cheapest is the best. Well the Japanese made Shinwa CTI-CP80 matrix printer is certainly one of the cheaper versions to offer the full range of features, including graphics.

First and foremost the Shinwa sells from under £300 and has both Centronics parallel and RS232 serial interfaces, allowing the machine to be used with most business micros and home computers including the Dragon, Orion, Apple and Sirius.

The machine has a paper width of 10 inches which is wider than A4, prints in black and white and has a buffer of 64K.

This buffer allows the machine to take instructions from the com-

puter in chunks of 64K. It means that while the printer is in action the computer can perform other tasks.

Text print speed on the Shinwa is 80 characters per second and quality is reasonable due to the 9x9 dot matrix printing.

Features include italic, condensed, emphasised and expanded print styles, vertical and horizontal tabs and an 80 column print width.

Going up market a short way, for around £545 the Brother HR15 offers higher text print quality than matrix printers because it is a low cost daisywheel printer with graphics capability.

Its speed is 13 characters a second and it offers compatibility with a wide range of micros with both the RS232 and Centronics interfaces.

The HR15 features red and black colour printing, paper width adjustable to 12 inches and a buffer of 3K.

For those wanting the exceptional quality of the daisywheel plus the occasional graphics capability this machine might suit very well.

Features include text reprinting for large quantities of reports and soon, auto under scoring, proportional spacing and a maximum of 165 characters per line. The HR15 is also quiet enough to use in a busy office.

Going up market again we come to the Anadex DP-9501A line printer, price around £1,150.

This machine has high resolution graphics capability which means it can place a large number of print dots in a small area.

The printer has a fast speed of 120 characters per second at letter quality standard. The machine also has the added option for those with data processing in mind of an alternative print speed of 150 characters per second.

High resolution graphics is achieved by the 11x9 dot matrix print head which allows 75x72 dots to be printed to the inch.

Paper width is up to 15.6 inches and the buffer is 2.7K which Anadex says allows maximum efficiency when operating in the graphics mode.

Like the other machines reviewed so far the Anadex has both RS232 and Centronics interfaces together with another current loop interface as standard, which covers

most eventualities in the choice of computer hardware.

A mark in the Anadex's favour is its low noise level.

Features include optional re-inking ribbon, printing up to 220 columns wide, double width and bidirectional printing, horizontal and vertical tabs and normal or compressed type styles.

Towards the top of the matrix printer range is the Facit 4544 which should sell for around £2,796.

The Facit's leading claim to fame is unlimited colour graphics capability. With a standard four colours integral to the machine Facit says unlimited colour can be achieved by overprinting one colour on top of another.

With a maximum print speed of 300 characters per second the Facit has an adequate 8K buffer and RS232 and Centronics interfaces. Paper width is a large 15 inches.

Features include the unique Facit font which through software commands can generate variable sizes of type characters. The company says you can put a dot anywhere on the paper and in any colour. Character sizes are software controlled and can vary from 1-96 characters. A 96 character roughly equals 9 1/2 inches.

Although the Facit machines speed is a fast 300 characters per second in print mode there are matrix printers available offering speeds in excess of 800 characters per second, but these machines do not necessarily offer graphics.

If high quality graphics are an integral part of the business requirement then perhaps two machines, a printer for text and a plotter for graphics may be the answer - the printer for print speed and the plotter for graphics accuracy and quality.

One of the lowest priced of the drum versions is the Strobe 100 costing £376.

The Strobe offers single colour plotting on paper 8 1/2 inches wide or A4 size.

There is no buffer on the machine but it does have the RS232 and Centronics interfaces allowing use to be made of the Strobe on most leading makes of microcomputer.

Although slower than many of its rivals the Strobe has an advantage in that it is well served by software enabling the plotter to be

The HP 7470A graphics plotter.

run off a large number of machines without the users having to write their own specialised software.

At just a tiny bit further up the market at £599 comes the Pixy three colour flatbed plotter.

With eight-bit parallel and RS232C interfaces the Pixy can be used by the home computer built as well as the business user with an IBM or Apple micro to produce bar charts, piecharts and flow charts etc.

Paper width is 8 1/2 x 11 inches and the machine can take either paper or film such as that used for overhead transparencies. Water, oil based and fibre tip pens are available for use with the machine.

Features include eight colour pen options, normal and extended and Greek type styles and local intelligence. This latter means the plotter can act independently of the computer to generate circles, arcs and spiral illustrations.

Just out is the new Hewlett-Packard HP 7470A supplied by Hi-Tech Distribution.

At £969 plus VAT it is a two pen multi colour plotter which is compatible with the Apple II, Commodore Plus, Hewlett-Packard 83 and 87 and IBM PC micros.

It can take either 8 1/2 x 11 inches or A4 paper as well as film for transparencies.

Two colour plots can be produced automatically and multi-colour plots with a manual change of pen. A new paper gripping technique is used for plotting which moves both pen and paper at the same time.

Features include five internal character sets, simple paper loading and the software allows users to give typewritten commands in plain English.

In a similar price bracket comes the £899 HP 4602 intelligent graphics plotter priced between £799 and £950, depending on

which interface is supplied with the machine.

The Iwatsu can take A3 and paper, has a choice of self or manual plotting mode and a random access memory of 14K and read only memory of 8K.

At £2,290 for the A3, 11 1/2 inch version, the Gould Callwriter is certainly not the most expensive of printers but it does offer a lot of the features seen in more costly machines.

It can use 11 pens, for example, which can be either fibre tip, ball, transparency quality or a popular Rotring disintegrating pen.

The machine has five different character sets, including Cyrillic and lower case draft quality and the warmifit Greek alphabet.

With variable line font, overhanging, bar and pie charts, arcs and circles can all be plotted on the Callwriter at a plotting speed of 40 cm per second. The more standard speed of plotters is around 10 cm per second.

Features include a buffer of 16K expandable to 160K and the 40 model can be programmed for unattended and continuous plotting through its automatic advance procedure. The machine still retains its facility for step sheet plotting.

Finally, at the very top end of the plotter market is Vecop which makes a range of plotters from a 22 inch version, capable of plotting on paper or film 22 inches wide with a plot width of 21 1/2 inches through plotters used up to 36, 42 inches up to the 72 inch version, the largest plotter on the market.

These plotters are suitable for plotting full size drawings, maps, schematic sections, piping and network diagrams, part charts and business systems.

BRITAIN'S PROFESSIONAL COMPUTER SHOW

And no doubt you will be at Compec too.
At Olympia, From November 15 to 18 1983.

Another year's gone by since the last Compec. Another year of progress, success, achievement and excellence.

And another year of problems, failures, hassles and disappointments.

That's why every computer professional and serious user needs to know what's on show at Compec.

There's no other exhibition with the quality, scope, size and sheer volume of information that's at Compec. There's no other show that repays so well the time you spend.

And there's no better way to spend a day in November than visiting Compec.

You'll know what's going on behind the scenes - and in front of them - to benefit your present and future operation.

Compec tickets cost just £1.50 in advance - that's half price - or £3.00 on the day. Clip the coupon and make sure you update yourself on the ever-changing world of DP.

Because there's no doubt, whatever your interest, whatever your need, it's at Compec 83, Britain's number one computer show.

NO DOUBT. IT'S AT COMPEC.

To: Compec 83 Tickets, Reed Exhibitions, Surrey House, 1 Throwley Way, Sutton SM1 4QQ.

Yes, I'll be attending Compec. Send me _____ tickets at the discount price of £1.50 each.

A cheque is enclosed for £_____ payable to Reed Exhibitions.

management at the Honeywell Educational Technical Centre in Minneapolis. His first tutorial, Database Management in the 1980s, is designed for managers and technical practitioners, and will provide an in-depth examination of the characteristics, advantages and disadvantages of DBM and DDP systems of the '80s. His second seminar, Facilities for End Users in the 1980s, will evaluate the trends and techniques which enable non-computer managers to interact more easily and effectively with computerised systems. There will also be

GREECE

LIANIS... "We don't want any colonial relationships with our partners."

Greece leapfrogs into information technology

Jack Gee looks at a nation seeking a foothold in the computer league

GREECE is about to embark on a venture to set up a microelectronics design centre and establish its own software industry, with the aid of Greek specialists now working in North America and Western Europe.

The design centre will be one of the key elements of a five-year plan to develop high technology industries, recently approved by parliament. It will get underway in 1984.

Struggling against inflation, which has been running at 25%, and a slump in receipts from tourism, shipping and Greeks who are working abroad, Greece may appear ill equipped after two years of socialism to move into the computer league.

But the country's leaders consider that the shortcomings of its

economy make it vital for industry to leapfrog into advanced information technology.

A start has been made with the creation of a research institute associated with the Institute of Information Technology at the University of Crete. The institute will work on office automation and other projects as a partner in Esprit, the Common Market's effort to make up the gap between Europe's computer industry and the industries of the US and Japan.

"We have the brains to do this," says Minister of Technology George Lianis. "We have the people - here and abroad - and the capability to develop our own software industry and move into microelectronics manufacture."

Coming from Lianis, this self assurance cannot be dismissed as

wildful thinking by a politician trying to whip up support at the hustings. The bearded, 56-year-old minister, who looks more like a university professor than a cabinet member, is the only one of the Common Market's 10 ministers of technology with a genuine background in the field.

He holds a doctorate in mechanical engineering from Imperial College, London, where he became a research fellow in aeronautical engineering. He taught in the US for 17 years before returning home after the overthrow of the military dictatorship.

Earlier this year he made a tour of the US and Canada to address meetings of expatriate Greek engineers, many of whom expressed enthusiasm to return and join in the national effort to endow the country with an information technology industry. Lianis has also established contacts with Greek experts in Britain and France.

At the beginning of this summer these specialists from the Diaspora gathered in Athens to take a final look at what was feasible. This seminar was the genesis of the Design Centre, which will be located in the capital and associated with the National Centre of Physical Sciences, Demetrios.

Between \$2 million and \$2.5 million are being allotted to this project. Greece has asked the Common Market for cash support to the tune of seven or eight million ECU.

At this stage we are not planning to build a chip factory of our own," says Lianis. "We want to start with a small VLSI unit for research and possibly for small-scale custom production. We intend to give special priority to CAD/CAM design and testing and to systems architecture."

Because Greek salaries are much lower than those paid in Western Europe and North America, the minister envisages high added value for both software and hardware.

But Greece will be particularly careful to ensure that foreign firms and countries do not establish a foothold with the objective of taking over this nascent industry. Although the Greeks realise they will need American technology, they are particularly wary of the US,

small country with limited resources. But there are easily defined stages by which we can break in."

The Design Centre will have the task of keeping up to date with the state of the art and finding ways in which to develop subsystems. Design will begin at university level and the centre will coordinate multipurpose chip design.

"The centre will have ample sources in computer power," says Katsifouras. "These will be located either in the centre itself or in silicon foundry abroad, where wafer processing takes place. This means that the design engineers can simulate what they are going to produce on a chip, as well as simulating the logic at circuit level."

Lianis stresses that high quality telecommunications are essential for gathering information on multi-purpose chips and communicating with facilities overseas. "This is one of the reasons why we are renovating our telecoms network and moving from an electronic mechanical to a digital system," he explains.

The government is currently studying tenders from GEC, Esprit, Siemens and IIT for proposals to set up a Greek switching exchange industry.

Currently running, the France is not competing for contact, although Thomson has installed Athens' international transit centre using the M3 system.

To help remedy Greece's lack of experience in semiconductor special centres are being introduced into university programmes. Katsifouras notes: "Since students need hands-on access to circuits, we are building fully fledged laboratory facilities for this purpose at the Demetrios research centre. Fundings totalling \$300,000 have been allocated for this task."

The Greeks consider that, at the crossroads between Europe and the near East, they are ideally situated - both politically and geographically - to export the products of their future microelectronics industry.

The Greeks consider that, at the crossroads between Europe and the near East, they are ideally situated - both politically and geographically - to export the products of their future microelectronics industry

with which they have just negotiated an agreement for the closure of US military bases within five years.

"We don't want any outright foreign investment," says Lianis. "We don't want any colonial relationships with our partners."

At an academic level, Greece appears well geared to launch into microelectronics and information technology. Computer science departments exist in all the country's six technical universities. As well as the overseas Greeks whom the government hopes to lure back, a number of trained specialists are already available at home.

"Our plan is to move into microelectronics in a manner that will produce the maximum impact for a minimum investment," says Stavros G. Katsifouras, who, after 22 years in the US, is now microelectronics consultant at the Technology Ministry.

Katsifouras explains: "To enter the microelectronics spectrum is a broad field. It is too expensive for a

selling microcomputers and software of its own design for the first five or six years.

Software, he says, provides immediate opportunities for development, because it is labour intensive. "We have unemployed people who are available to design, as well as to help with the telecommunications aspect of hardware."

Greece is particularly keen to service its data packet switching needs. Katsifouras says: "A major problem is how to transfer information. The know-how acquired in research projects launched by the French's National Centre for Telecommunications Research is particularly well. The research experience has been passed on to French industry with results. We should like to follow this example in Greece."

He adds: "The great advantage of the modern technologies is that you can jump on the train at any stage. But you have to be careful because there are built-in ob-

Networking standards make rapid advances

Dr Ken Beauchamps of Lancaster University reports on a NATO Advanced Study Institute on Information Technology and the Computer Network

NATO Advanced Study Institute on Computer Networking has been part of the regular success at the Chateau de Bonas in the South of France since 1978, when the first meeting on interlinking computer networks took place.

In 1981 a second meeting on advances in computer networking reflected the considerable progress that had been made during the intervening years, particularly in the area of communication protocols. (*Computer Weekly*, July 23, 1981).

This year's meeting, occupying 10 working days between August 22 and September 2, co-directed by Dr Jack Howlett and myself, was concerned with the computer network supporting the wide range

Standards mean achieving certain levels of excellence and levels of performance, as well as uniformity of dimensions, operations and protocol. Above all, OSI (open systems interconnections) does not mean open to several interpretations.

The meeting was particularly fortunate in having a workshop on the British initiative in IT - the Alvey report chaired by Brian Oakley, the director of the UK Alvey Programme.

The Alvey Report stemmed from the Japanese Programme for the Fifth Generation of Computers and after a visit to Japan by the British team, led by Sir Robert Telford, it came back convinced that the UK must have a parallel initiative of its own. Brian Oakley described the shape of this programme in terms of VLSI, software engineering, information knowledge-based systems, computer power and man-machine interface.

It was the shock of realisation of Japan's determination to go ahead fully in these areas through its long-term ICOT programme that led to the formation of not only the UK's Alvey programme, but also the European Esprit scheme, and several US initiatives such as the MCC and DARPA programmes for powerful networks and computers.

Brian Oakley paid tribute to the enthusiasm of Sir Robert Telford of GEC and Kenneth Baker, the Minister for IT, for getting the Alvey Programme off the ground. This is probably the first time outside a wartime situation that the nation has co-operated in such a way over a single technical project and he expects that the programme will double Britain's research manpower within the next five years.

Although the programme he is managing is a British one he anticipates full co-operation with Esprit and many other similar worldwide programmes. He hopes this will enhance the benefits arising from the work for the remainder of this decade.

Later in the week we were to learn something of the US supercomputer projects from Professor Frank Kuo of SRI International, US. The two principal projects are the \$46 million Fifth Generation Computer Project, the DARPA technology-based supercomputer project for which \$40 million has been allocated and the MCC (Microelectronics Computer Technology Corporation), a joint project for 10 US companies.

The goals of these projects were described as leading to knowledge-based information systems, speech and natural language understanding, vision processing, parallel architecture and a supporting network hierarchy.

The reward is technology leadership and market dominance and it is Kuo's view that we can expect to see the emergence of those presently little-known, small companies which can afford to be innovative and take risks that the large, organised corporations feel unable to take.

In an important session in standardisation, the principal speakers were Professor Hans Helms of the Commission of European Communities (CEG), Jim Brookes, director of the UK South-west Regional University Computing Centres, and Jack Houldsworth of ICL.

Professor Helms stated that the CEG has invested heavily in international standardisation since 1979 and its strategy is similar to that proposed under the Esprit programme and Euronet, with which

it has close co-operation links. The number of agreed and operational standards within the various levels of the ISO seven-layer protocol model is already very impressive, 47 in layer seven, 18 in layer six, etc. There are over 100 in all, plus 75 standards which do not involve data links.

The manufacturer response to these standards has been good - they need the market. The user response has not, however, been as good and this points to an educational need which is far from complete.

As with many such organisations, the CEG is presently considering a strategy for the introduction of OSI standards to ensure that systems which are being planned now to use data transmission facilities (both wide area and local area networks) can be structured so that they use OSI standards as they become available. This is known as "intercept strategy" and we heard many views on achieving this during the conference.

Jim Brookes of the UK's SWURCC gave the universities' interpretation of this strategy. He described protocol standards as a mechanism for holding together a dispersed collection of user services. The benefits are connectivity and protection of user investment in hardware and software.

A large computing centre serving the needs of a number of universities over a wide geographical area cannot change its mode of operation abruptly and SWURCC is seeing a gradual change from "home-grown" network protocols to full X25 international protocols using expandable gateway protocol converters.

This intercept strategy is working, but the future for this and other providers of IT facilities is going to be PABX linkages and users for which standards do not yet exist.

This view was also expressed by Jack Houldsworth of ICL who stated that PABX and LAN must be connectable in the long term if we are to realise the advantages of

voice and mixed-mode text and graphics communications. The key is probably a gateway which must let in to standard system architecture.

In many ways he considers the chip manufacturers are getting ahead of the agreed standards organisations and perhaps greater attention should be paid to these manufacturers. There is a great need to bring together the silicon chip manufacturers to ensure that the standards agreed are actually implemented correctly.

The OSI standards themselves and where we have got to in their implementation were described by Bill McCrum of the department of communications, Ottawa. He defined open systems interconnection as "a concept whereby information processing systems may communicate without needless constraints engendered by equipment choice".

The achievement of openness in systems interconnection demands that many fundamental components of information technology and the computer network be structured around these standards and he left no doubt in the delegates' minds that this is a top priority for all present-day inter-networking activity.

One of the most sophisticated open networking systems available at the present time is Project Universe, an imaginative concept

involving co-operation between GEC-Marconi, Logica, British Telecom, the Science and Education Research Council, Cambridge, Loughborough and London Universities. It is funded at a current level of £3 million from the Department of Trade and Industry over 1981-1984.

Chris Adams of SERC described the basic components of the Universe network and some of the communication experiments currently being carried out with it. This is a big WAN/LAN project, involving satellite communications via an orbital test satellite (OTS).

Unlike many other systems described at the meeting of the Universe network is a packet switching system which uses "lightweight" protocols, considerably simpler than the X25 protocols used in the inter-university network. They enable data to be transmitted via "virtual circuits".

These virtual circuits do not have error-recovery of flow-control imposed by the network. Instead it is left to the end-user to arrange these management functions. An advantage claimed for this method is that widely different applications such as packet voice, slow scan television and file transfer can be handled fairly efficiently and this may be important in future add-on services for IT communications.

In a session on message handling, chaired by Doug Steedman of Bell-Northern, Canada, the impor-

BROOKES... "Protocol standards are a mechanism for holding together a dispersed collection of user services."

tance of a growing area of IT, namely voice, video and mail traffic, became apparent.

In his own organisation considerable use is being made of high quality print transmission, i.e., digital facsimile and mixed-mode data. He claimed that message handling was one of the earliest applications for OSI and that the specifications proposed originally by IFIP have been taken up and incorporated by CCITT in its new internationally agreed standards.

He stressed that message handling in IT is for people and that suitable directory information and distribution lists must be available addressed by attributes and not by means of an identification number or code.

An interesting insight into message handling for another large organisation the French Societe Internationale de Telecommunications Aeronautiques (SITA), was given by Georges Girardot.

He referred to the "teleomatic revolution" which has affected many business organisations through the progressive introduction of videotext, telex, telefax and teleconferencing where the worldwide availability of low-cost data communication has made possible the international deployment of data networks and satellite systems. These are likely to induce lasting changes in human activities of similar importance to the introduction of computers.

MAKE A DATE FOR THE UK'S PREMIER COMPUTER TRADE EVENT

The Computer Trade Show '84

Wembley Conference Centre March 13-15, 1984.

Sponsored by Computer Weekly, Practical Computing, Systems International, Micro Business and Software. Organised by Reed Exhibitions.

If you're in the computer business you should exhibit at the Computer Trade Show '84. The first show in April '83 was universally acclaimed as successful in attracting the right kind of serious visitor - visitors who would mean business for you.

Building on this success, The Computer Trade Show '84 will have an enlarged exhibition area, and a repeat of the highly-targeted promotion used in '83 will guarantee the excellent quality of visitors.

To get further information telephone Chris O'Hea, Exhibition Sales Manager on 01-661 3125 or complete and return this coupon.

WARNING: COMPUTER DATA Are Your Presentations a Pain in the Neck?

We all know the problem! Too many people straining their necks to see too few monitors. The audience lose interest and your presentation, exhibition or demonstration loses its impact.

The Reflex Data Projection System was designed specifically to present computer information in a clear and effective manner to large audiences. The 20 MHz video bandwidth can handle up to 132 char/line and presents a sharp P31 green image up to 10 feet across. At Reflex we can directly interface to any computer.

So if your audience is getting a pain in the neck - why not ring us on (0734) 884611

BOOKS

Gamblers who influenced industry

Grammatical Man, Information Entropy, Language and Life. Jeremy Campbell. Allan Lane. Penguin. £12.95.

ONE of the better things about the computer industry, someone once said to me, is that it has more lunatics per square foot than most industries have per square mile. The still better point is that the two people most influential on the theories which underpin the industry, were both gamblers – a fact neatly brought into context by Jeremy Campbell.

Claude Shannon, father of information theory and a major contributor to the mathematical concepts that underlie most of the communication structures in machines, virtually gave up his work to dabble on the Stock Exchange, testing his own theories of randomness.

John Von Neumann, the other great theoretician of the early computer age, was a poker player.

What united Shannon, Von Neumann, Escher, Godel, ancient figures like Aristotle – and some not so ancient, like the linguist Chomsky – was a theory about language and information.

Put in its somewhat oversimplified form, each of those figures, often in different ways and about different topics, conceived of the world as animated by a deep structure, which worked from within to create not order, but variety.

Variety, because its appearance in the natural order is a macroscopic defeat of the law of entropy, is a significant feature of information itself, according to Campbell.

Kevin Cahill

Feel the way through the Fifth Generation

Towards Fifth Generation Computers. G. L. Simons. The National Computing Centre. £10.50.

THE Fifth Generation: the Threat, the Promise, the Sequel, the Film and now, The Fifth Generation Strikes Back.

After IBM, the now ubiquitous Japanese project to obtain precisely 37% of the market in information technology by 1990 must be about the most overwritten topic in the industry.

Having said that, it is also, just like IBM, remains one of the most opaque topics too.

The volume of copy and the endless flow of ink have left almost everyone, including one often suspect, the Japanese themselves, thoroughly in the dark as to what the project will produce by way of computers.

Geoff Simons' book is not so much a light in the darkness, therefore, but more a kind of guide to the all encompassing gloom.

As such, it is going to be valuable to anyone who, through either choice or necessity, has got to attempt to understand just what the Fifth Generation project might (the stress in on "might") be about.

Apart from that, it won't shed much more than indirect torchlight on what the men from the land of the rising sun are actually trying to build.

Simons just offers a simple and thorough guide to all that's been said so far – a limited goal, clearly accomplished.

Kevin Cahill

We've been invited to a seminar entitled "Modern Communication Systems" which was held last week.

Are computers alive?

Are Computers Alive? Geoff Simons. Harvester Press.

GEOFF Simons certainly has a way with words. To support his view that computers are alive he states that a computer can be said to be suffering from mental disease if it "behaves oddly", that computers have reproductive systems because they can build other computers and that they can see and think.

He argues that a computer can beat an oak tree at chess, weld better than a frog and is "at least as clever as a cactus". As a result, his book, *Are Computers Alive?*, is one to be frightened by or to scoff at.

Simons' arguments are powerful, because he describes computers mainly in human terms, with little reference to the humans driving them. Words like touch, see, understand and think are used liberally in describing robots and computers.

Simons is chief editor at the National Computing Centre. It is surprising to find such an eminent person using language in this almost dishonest way. Animals only have hands, he says, but "robots have developed to exploit a wide range of manipulative methods".

In other places Simons brings in science fiction in such a way that it appears to be reality of future possibility purely because it is written by respected authors.

The book considers what life is, then looks at the "anatomy", "behaviour" and "psychology" of computers.

Towards the end, Simons takes his arguments to the logical conclusion by considering the emotions and rights of computers. And he closes with some questions raised by the idea of living machines: can a computer stand for parliament and would you let your daughter marry one?

The arguments are chilling for the believer and interesting for the non-believer. Even the scoffers will find this a fascinating work.

DATA ENTRY

One of the biggest key-to-disc set-ups in the UK is being implemented at the PPA, which deals with 330 million prescriptions a year... Nicholas Enticknap reports on a complex system, facilitated by batch data entry

Just the prescription for chemists' headache

ALMOST since the dawn of the computer age, there has been strenuous debate between those who want computers to be as easy to use as possible and those who argue that technical efficiency necessitates a certain degree of complexity.

Probably the first practical application of this argument was over assembler versus high level languages: its most recent appearance has been in the discussions of Apple Computer's new Lisa office system, which carries the ease-of-use principle on personal computers much further than anyone else has yet dared to attempt.

For the average computer professional, the question most often

occurs when considering interactive against batch data entry.

To judge from much that is written in the Press, you might think that this question was resolved about 15 years ago — that batch data entry is as outmoded as the biplane and that nobody in their right mind would consider anything but interactive data entry for any new application.

This is not at all the case: batch data entry continues to be substantially the most cost-effective solution for many applications in many organisations. An illustration of this point is provided by the Prescription Pricing Authority (PPA).

The work of the PPA is not widely known: it's unsensational,

so gets little publicity. For most of us, when given a prescription by our doctor or dentist, it is a matter of going to the nearest chemist, paying the fee (unless exempt), and taking the tablets or whatever, and that's the end of the matter.

For the chemist, however, there is the small matter of payment to be considered. The average cost of each prescription, taking into account the drugs themselves, the dispensing fee and the chemist's overheads, is £4, so the prescription charge, much though it has risen over the past five years, doesn't remotely cover it. In any event, some 70% of all prescriptions are exempt from fees, because the patient is a child, a pen-

sioner, unemployed or on supplementary benefit. When you take this into account, prescription fees cover only 10% of the chemists' costs, and that leaves the country's pharmacies collectively over £1 billion out of pocket.

This is where the Prescription Pricing Authority comes in. The organisation is a part of the National Health Service (though it is much older than its parent body, having been set up before the First World War by Lloyd George). Its job is to receive every prescription form tendered to any pharmacy in England, to calculate the value of each, and to produce schedules of payments to the chemists.

In terms of paperwork, that is a formidable task. Currently about 330 million prescriptions are issued a year. Each has to be accurately deciphered, checked for a variety of conditions, and priced. There are about 19,000 different types of drug, each with its own price, and to complicate matters

Authority started to fall behind with its pricing workload and that prompted an official investigation into its methods of working. A top-level consultant (R. I. Tricker, director of the Oxford Centre for Management Studies) was called in to assess the situation and recommended methods for improving the processing of information. He produced a detailed report in 1977. The pricing operation came out of it with high marks for efficiency, but computerisation was recommended to improve the exploitation of information.

A major question in the planning stage that followed concerned the method of entering data to the computer system. How much data should be input? Should the prices continue to be calculated manually, or should the drug names and packet sizes be input only, with the prices calculated by reference to a look up table?

Analysis showed that the bulk of the job was deciding what to enter

rather than the data entry task itself, and the computerisation of the pricing function, therefore, was simply not cost-effective.

A series of data entry system trials were then undertaken. Three types of system were evaluated: an OCR system, an interactive menu-driven system and a key-to-disc system.

The OCR system required chemists to stick bar-coded labels on the prescription forms, which was time-consuming in itself and prone to error, and the method was quickly discarded as not being productive enough.

The other two systems produced comparable results for a time, but as the trials wore on the key-to-disc system started to show greater and greater productivity.

"This is because of the nature of the application," said Arthur. "The pricing clerks rely heavily on their memories after a time: for most prescriptions, they don't have to look up the prices, but just write them on. We also found the interactive system to be less helpful as a training aid than we expected — the biggest factor in the job is the ability to read and interpret the forms."

The trial eventually provided conclusive evidence that key-to-disc was the most cost-effective data entry method. Rediffusion Computers emerged from a selection process involving 25 companies as the supplier of the initial system. The company has also provided the PPA with an audio-visual training package, developed by education services con-

sulting operators how to enter data into the system.

An idea of the thoroughgoing nature of the trials can be gained from one of its minor findings. It was decided to modify the keyboards so that each had by enabling the entry of the numbers 30, 60 and 100 with just one keystroke. These numbers are the most common packet sizes for tablets, with about a half of all prescriptions being for one of the three. The Authority calculated that, as a result of cutting the data entry task required for these numbers from either two or three keystrokes down to one, it would save £1 million a year.

With similar thinking, a special set of numeric code numbers has been devised for the most common drugs, different from those stated by the NHS. These are numbered so that the commonest drugs of all, such as diastyls, have a one digit number (plus check digit), the slightly less common have two, and so on down the

list.

The most common 3,000 drugs which account for 96% of all prescriptions, have been allocated these numbers that are converted into their appropriate NHS code after entry to the mainframe. By this means the average keying requirement for each drug identifier has been cut from five alphabetic characters to three-and-a-half numeric characters.

At the time of writing, Rediffusion Computers' R288 system has been installed. The configuration includes one megabyte of main memory, 133Mbit Winchester disc, tape drive, printer and communications facilities. Eight similar systems are in order.

That might seem an enormous amount of data entry capacity, but it will only serve two of the PPA's 11 processing divisions.

The implementation of computerisation will not be complete until 1985, by which time the PPA will have 36 key-to-disc systems supporting, in all, some 1,000 workstations. The data produced by these systems will be processed on some four or five different mainframes.

When the implementation is completed, the PPA will have one of the biggest key-to-disc set-ups in the UK.

Anyone who still needs convincing that batch data entry is not very much alive and kicking need look no further for an ideal illustration of how to tackle a complex

The new computerised system at the PPA for calculating each prescription form and producing schedules of payment.

LEGAL DATABASES

Emergent countries are unable to put their legal materials in writing. Charles Christian examines the feasibility of storing them on computers instead

Keeping the laws of the Commonwealth

WITHIN the next few weeks, the Commonwealth Secretariat, based at Marlborough House, London, will be commencing a study of the potential for computerisation of legal materials and the use of database retrieval systems by lawyers in developing countries.

The study is going to be carried out by the secretariat's legal division and come, as a direct result of talks that took place earlier this year at the Commonwealth Law Ministers' Meeting in Sri Lanka.

The topic of the computerisation of legal materials was first broached by Commonwealth countries at the 1980 Law Ministers' Meeting in Barbados, when delegates from Canada and Barbados both presented papers on the subject.

At that time the costs of computer technology were relatively high and so, although there was "a lively discussion", much of the debate was concerned with the more general, theoretical benefits that information retrieval services could offer the legal profession.

By 1983, however, the position had changed quite substantially. Much of the initial education work had already been done and the la-

reports at ruinously expensive prices.

For smaller jurisdictions, however, such as Scotland, the position is far worse. The economics of preparing, printing and publishing law books for such a narrow market is making the whole operation no longer viable.

How much worse, then, is the problem for some of the emergent nations of the Commonwealth, which, until recently, relied almost entirely upon the facilities of the old imperial "mother country" for their legal publishing.

Perhaps the most ominous example of the type of problems that can arise comes from one of the small Pacific island-states.

Recently, at considerable expense and with the assistance of a UNESCO grant, the island hired a team of legal academics to write up all that country's law.

Once this task was completed, the island's government investigated the possibility of having the manuscript published in book form. The cost, it was discovered, would have taken up a considerable proportion of the annual income of every individual on the island.

Consequently, the project had to be scrapped and to this day the only comprehensive copy of the island's law is the researchers' original manuscript.

There is, therefore, a possibility that in some parts of the world the tradition of the laws of the land as a body of written documents is in danger of dying out.

That is where CALR systems enter the picture. A number of countries — the first was Canada — have been quick to spot that text captured in magnetic form once could aid the legislative drafting process by expediting the production of successive drafts as they were required (by elementary word processing techniques).

Moreover, it could also create a final copy of the text, which would be suitable for subsequent information retrieval from a computerised law database.

The 1980 Law Ministers' Meeting concluded computerisation could mean that the legal systems of developing nations were "on the verge of a new era".

But this optimism was tempered at both the Barbados and Sri Lanka meetings by a note of caution, which, for convenience, can be divided into "practical" and "jurisprudential" objections.

On the practical level, it was pointed out by the Barbados delegates that if you are going to put all your legal eggs in one computerised basket, it is essential that you have sufficiently reliable technology to support your databases.

In Western countries air conditioned computer rooms are taken for granted, but in equatorial Africa, with far greater temperatures and humidities to cope with, the problems are totally different.

Another problem is international telecommunications, which would have to be of an excellent standard if, for example, your country is linked into one of the US CALR systems such as LEXIS, based in Ohio.

If, as some countries are doing, you opt for a domestic CALR system, it is vital that the country should have a reliable electricity supply network, so that databases are not degraded by spikes or power cuts.

The significance of this last point was made all too clearly at the Sri Lanka meeting when one of the formal state receptions was

plunged into darkness by a power failure for over an hour.

Possibly the most prickly problem countries are likely to face, however, concerns the jurisprudential objections to CALR systems. These were discussed in some depth in Sri Lanka, following papers by the federal government of Australia and Professor Colin Campbell of Queens University, Belfast.

Many of the points they raised appear to have no immediate solution, and it is these issues that the Commonwealth Secretariat hopes to be able to tackle.

For example, should governments opt to develop a unified system under their own direct

control? Is this tantamount to "reinventing the wheel", when it would be better to leave it in the hands of commercial organisations than risk a proliferation of competing but incompatible systems?

Then there is the question of whether commercial organisations would establish and exploit what in some cases would be a monopoly situation, forcing users to hire grossly expensive dedicated terminals and charging lawyers exorbitant fees for access to vital databases.

There are worries that the cost of CALR systems will lead to a harmful division in the legal professions of the world between the rich practices that can afford

all the latest devices and their poorer brethren, who would only be able to supply a second-rate service.

Finally, there has been a lot of concern expressed about the issue of the "national sovereignty" of legal data. Many countries, through lack of resources and expertise, would be unable to establish CALR systems themselves and so would have to rely upon the services of a foreign provider.

Is it desirable, however, that a country should not have the only comprehensive record of the law of their land located in their own territory and under their own control?

As Professor Campbell pointed out at the Sri Lanka meeting, the computerisation of the law has opened up "a whole can of worms" — a can placed firmly in the lap of the Commonwealth Secretariat to do something with.

LITIGATION

Is IBM adding the insult?

Bob Djurdjevic looks at the motives behind IBM's courtroom activities

IT SEEMS unlikely the title of a 19th century novel, *Crime and Punishment*, by Dostoyevsky, should befit a contemporary legal battle between warring computer companies. Yet IBM's latest escalation in its court proceedings against Hitachi and its American partners raises new questions about crime and punishment.

The point has been made that crime doesn't pay. If a company attempts to gain unfair market advantage by stealing a competitor's trade secrets, the culprit and employees punished.

Federal Judge Spencer Williams saw to it that justice was done when he sentenced Tom Yoshida, president of NCL Data Inc of Santa Clara, CA, in June of this year to two years probation and a \$7,500 fine for helping Hitachi acquire stolen IBM trade secrets.

In February of this year, Hitachi and two of its employees pleaded guilty to the conspiracy charge in the indictment. The Japanese computer and electronics company was fined \$10,000 — the maximum fine possible under the law. The two employees were sentenced to five and two years' probation, and fined \$10,000 and \$4,000 respectively. Charges against two other Hitachi employees were dismissed in April.

The two National Advanced Systems engineers, also involved in the affair, were summarily dismissed by the company.

Yoshida's sentencing concludes the Justice Department's case against Hitachi and its employees who remained in the US to face the charges.

Adding to the legal carnage left in the wake of this case, Hitachi reportedly also cut the salaries of several of its senior executives earlier this year. Among the executives who suffered this humiliation were Hitachi's chairman, Hirokichi Yoshiyama, and the company's president, Katsushige Mita.

The case, labelled "Japanescan" by the press, has received almost as much publicity in the trade press as the Watergate scandal did in its time in the daily media. Such adverse publicity added public embarrassment to the court fines of the defendants.

In September 1982, IBM launched civil lawsuits against Hitachi, National Semiconductor Corp, and its subsidiary National Advanced Systems (NAS). IBM charged the three defendants engaged in "unfair business practices" when they allegedly tried to "misappropriate" confidential IBM product information.

IBM's legal action helped rekindle media and public interest. In November 1982, Hitachi and NAS agreed to turn over the allegedly stolen documents and allow IBM to conduct its own discovery to find out how NAS gained possession of the secret material. The stipulation was that the parties would try to settle out of court.

On the defensive — and under pressure — NAS president, Floyd Kvamme, resigned late last year for what he called personal reasons, amid speculation by some observers that the IBM case may have been a factor in the timing of his decision to leave.

In March of this year, NAS new president, Dave Martin, said he expected a settlement with IBM "within 30 days".

But this was not to be. Last April, IBM announced that the settlement couldn't be reached and court proceedings would resume.

The above is a summary of the 14-month-long confrontation between the FBI and IBM, representing the injured party, and Hitachi, NAS and Mitsubishi Electric Corp, to the roles of offenders. Most offenders have been punished. Some even humiliated.

But that does not seem to satisfy IBM. In the latest attempt to escalate the civil lawsuit against National Semiconductor, NAS and Hitachi, IBM recently filed court documents alleging the defendants took officials — not just the two NAS ex-employees — knew about and used allegedly stolen IBM confidential technical manuals.

"At least a dozen" NAS employees, including its senior management, took part in this process, according to IBM's latest charges. That means at least 10 NAS executives may have been involved.

If true, such business practices by NAS executives are indeed deplorable and worthy of severe punishment. Yet IBM failed to name any of them, thus smearing many innocent people's reputations by inference.

This makes the onlooker wonder about IBM's motives in escalating the case. Has this affair become a marketing, rather than a legal contest?

An IBM spokesman at first said he did not think the company was after a monetary compensation.

Later, he corrected that by citing a 10-point document filed in the court by IBM early in August, seeking that the defendants be required, among other things, to refrain from using the stolen technology in their products, return to IBM all of its confidential documents, and vow to not engage in

such activities again. IBM also asked the court to assess its damages — trebled — as well as award it punitive damages, court costs and reasonable legal fees.

An NAS spokesman volunteered some information to IBM during its negotiations for an out-of-court settlement. It is possible that IBM is using some of that information now, many months later, to escalate the charges.

If this is true, additional questions of business ethics may arise, this time with IBM as a culprit. Although lying low, Hitachi is not quite ready to play dead. Last month the company filed a countersuit against IBM in a Tokyo court, claiming IBM had no right to stop Hitachi from any of its design, development or manufacturing efforts.

IBM's recent escalation of the US lawsuit may well have been prompted, in part, by Hitachi's legal action in Japan.

The IBM motion, filed in the US Federal court in San Francisco on August 8, asked the judge to enjoin Hitachi from carrying out its Japanese suit, and to advance the trial date.

IBM's sudden haste to get to the trial may well be a sign the company is having second thoughts about this prolonged litigation, especially now that Hitachi is fighting back with its own battery of lawyers. But, the only thing certain at this point is that everybody's lawyers will be kept busy.

At the same time that the legal battle between IBM and NAS was escalating, the Central Bank in Oakland ironically became the hundredth customer for the Hitachi-made AS/9000 mainframe — just a year and a few months after the first customer shipment.

The first 100 AS/9000 customers included many highly respected Fortune 500 companies, as well as government agencies. About 50% of the AS/9000 installations represent new accounts for the plug-compatible vendor.

As a result of NAS's sales success, the company's financial picture has also improved, with revenues for the year ending May 31 exceeding \$300 million.

Yet, following the publication of IBM's renewed legal efforts in this case, National Semiconductor stock fell 1.5 points (3%) in one day, at a time when the Dow Jones index rose 8.44 points!

However, the relative success of both rivals obscures the question of how much better NAS would have done had it not been for the IBM lawsuit.

In the short term, IBM's courtroom tactics seem to have been effective.

But by pursuing the legal battle with such vigour, IBM may be tipping us off about its secret fears. Is the company admitting NAS and Hitachi are a real threat as competitors?

Even the American public may soon start to question if adding insult to injury can be called exemplary behaviour by one of the world's most admired corporations.

Bob Djurdjevic is a computer industry analyst, president of Annex Research, and publisher/editor of the Annex Computer Report.

Now it's possible to build a spreadsheet, generate a pie chart, change the pie chart to a bar graph, edit the memo, add a free hand drawing, and then get an exact print out of the whole thing with one hand tied behind your back.

Everyone works by using tools to shape information drawn from different sources.

Putting together a report, for example, by taking facts from one document and figures from another. Using a calculator to isolate trends. Drawing graphs to show an overall picture.

Now you can do all that using the most powerful personal computer around—Apple's new Lisa.

So powerful that six essential business tools built-in and totally integrated... for numerical word-processing, filing, graphics, illustration and project management. And yet so simple to use you can cut information from one program and put it into another with one hand.

And once you've learnt to use one program you've learnt the basic principles of them all.

—THE MAGIC OF A MOUSE—
Lisa is incredibly fast to work with because of a clever desk-top device called a "mouse."

By moving it you move the cursor on the screen, pointing to the function you want to employ.

Click the mouse while the cursor is over the symbol of the function and Lisa gives you instant access to it.

Lisa's functions are clearly and simply represented by symbols. The symbol for stationery

looks like a piece of stationery. Files look like files; a clipboard like a clipboard.

There is a calculator and a wastebasket too: all at your service at a move of the mouse.

Later, Apple Net will give you communications through an in-tray and an out-tray (on your Lisascreen of course). Lisa Terminal lets you open windows, to fill with information from another computer for analysis.

NO PERSONAL COMPUTER HAS EVER BEEN THIS POWERFUL.

For people who want to run tailored programs, Lisa runs BASIC, PASCAL and COBOL high level languages.

Hardware includes a 1 megabyte microprocessor main memory and 1.7 megabytes of built-in storage on two floppy disks.

Let's you "cut and paste" everything from spreadsheets to business word processing—at the same time.

A 5 megabyte ProFile hard disk storage allows all Lisa applications to be stored on one disk. A high-resolution screen makes Lisa graphics very special.

Lisa's dot matrix printer (160 x 144 dots per inch) features proportional spacing with bold, italics, or underlined characters. And Lisa lets you print in any one of 11 different type styles.

The same high level graphics you get on the screen you get on the printer.

—YOU'VE GOT TO SEE IT TO BELIEVE IT—

To see how revolutionary Lisa is to work with, you've got to work with it.

Fill in the coupon below and we'll arrange a demonstration. And you'll see why, although you can use it with one hand tied behind your back, Lisa will untie your hands.

Everybody should have a friend like Apple. Apple

I'd like to see Lisa in action.

Apple Computer (UK) Ltd., Eastman Way, Hemel Hempstead, Hertfordshire, HP2 4BR. FREEPOST.

There are worries that the cost will lead to a harmful division between rich practices and poor

ways of the Commonwealth had successfully been sold the idea of computer assisted law retrieval (CALR) systems.

The costs of computer equipment had fallen quite dramatically; and a number of commercial organisations had established electronic legal databases and were marketing competitive CALR systems.

From the point of view of Third World countries, computerisation might provide the only answer to their problem of establishing a thriving legal profession and systems of justice.

The essence of any legal system is a readily available permanent record of all the laws currently in force at any one time. This means not only having copies of legislative acts and statutes, but also in "common law" countries (which include the UK and most of the Commonwealth), having a record of the judges' arguments and decisions in all "leading cases", establishing precedents and points of law.

If this were not enough already, you also need commentaries on the laws for the benefit of practitioners, and text books for the benefit of students.

Now in England and Wales — which for legal purposes are a separate jurisdiction from the rest of the UK — there is a well-established and fairly sophisticated, conventional legal publishing system in existence. But even that is having to price books and law

The Ampex D150E with an ergonomically designed keyboard.

Ampex designs a terminal for Europe

AMPEX Corp is extending its family of video display terminals with the D150E, a low-cost editing terminal that has an ergonomically designed keyboard for the European market.

Like the current D125, D150 and D175 versions, the latest Ampex terminal cumulates 20 models made by six other terminal manufacturers. Its design uses the latest available integrated circuits, which reduce component count by 50%, giving increased reliability and lower manufacturing cost.

Announcing the D150E, Bob Trick, marketing manager of Ampex International's Europe, Middle East, Africa area, said: "Ampex has developed the D150E in direct response to the needs of some of our European customers who require the fully ergonomic

keyboard which features 30mm line row height and 8 degree slope.

"The Ampex terminal offers a choice of amber or green colour screens as well as eight national character sets (available by menu set-up)."

Ampex designed the new model D150E using the latest keyboard technology. The 16 single-stroke function keys (32 with shift) are programmable from either the host computer or the keyboard. The keys are sculptured and have pre-set spring pressures (70 grams for normal keys and 100 grams for the function/edit keys). Up to 5 LEDs can be added to the keyboard to identify special operating modes.

Ampex International (CW) Acre Road, Reading, Berks RG2 0QR.

I/O boards expand Alpha systems

ALPHA MICRO has introduced two new input/output component boards designed to expand the capabilities of Alpha Micro systems.

The AM-1003 is a multi-function board designed specifically for Alpha Micro's AM-1000 desk-top model microcomputer. It features four serial ports and one parallel port, allowing the system to support up to seven users as well as a printer. The standard AM-1000 contains three serial I/O ports.

At the user's option, the AM-1003 can also be used to run CP/M, the microcomputer operating system now offered by Alpha Micro, or Alpha RJE, the company's communications option which allows the system to "talk" with other Alpha Micro systems or other manufacturers' systems which use IBM's bisynchronous 2780/3780 protocols.

When either CP/M or Alpha RJE are in use, the system will support two terminals, which means that for the first time, CP/M may be called up from any terminal connected to the system.

The AM-330, a data communications controller, is a multi-function I/O board designed for use with Alpha Micro S-100 bus-based systems.

Alpha Microsystems (GB) (CW), Berkshire House, 56 Herschel Street, Slough, Berks SL1 1PY Tel: Slough 821922.

PC Mouse from Data Design Techniques.

PC friendly with the Mouse

PC MOUSE from Data Design Techniques is said by the makers to add a new dimension in user-friendliness to the IBM Personal Computer.

It eliminates many of the laborious cursor and keyboard control operations allowing the businessman to concentrate on using the computer rather than wasting time learning complex keyboard control sequences and how to be a typist, says Data Design Techniques.

PC Mouse is a compact hand-held device which translates movement over a desk-top pad into

movement of the screen cursor. Pointing to a given screen character in this way is faster than using the keyboard.

Click-buttons on the PC Mouse can be used to replace sequences of up to 15 keyboard strokes. There are three buttons, and clicking each one, two or three times initiates three 15-stroke keyboard sequences per button. Thus the user has a total of nine sequences of 15 keystrokes to call on without having to touch the PC keyboard. This can be a boon to the non-typist - not having to fumble around with the keyboard or hav-

ing to remember complex sequences, says Data Design Techniques.

Once keystroke sequences have been set up for a particular program, they are retained in the Mouse each time the program is used.

PC Mouse is ready to run all popular programs such as VisiCalc and Wordstar.

For software developers, it offers the MouseWindow package. Data Design Techniques (GB) 68/70 Tewin Road, Welwyn Garden City, Herts AL7 1BB.

IBM plug compatible stations

WALMORE Electronics has introduced display stations which are plug-to-plug compatible and interchangeable with the IBM 3278 and 3178 display stations. These terminals can be used as S-370, 43XX and 40XX processors and 8100 information systems.

Coaxial cables connect the display stations directly to the IBM 3274 and 3276 control units and to the 4341 processor.

The ergonomic design features a user-adjustable screen position with tilt and swivel of 120 degrees to either side, a low-profile, lightweight and moveable keyboard and a green, non-glare screen. A cubiner hood to protect the viewing area from direct light. Standard features include an audible alarm and 87 keys with 28 program functions.

Walmore Electronics (CW) 11-15 Betterton Street, London WC2H 9BS. Tel: 01-836 1224.

Walmore's IBM plug-compatible display station.

Father and son venture at Crown Acoustics.

The silent approach

WITH EEC regulations limiting maximum printer noise coming into force next year, a new company has been launched specialising in up-market printer silencers.

Crown Acoustics, a joint venture between father and son, does not intend to rely on percentage noise reduction claims and subjective listening tests to prove the worth of its silencers. Instead it has invested in decibel meters as part of the demonstration kits.

"Most printers emit noise of 80dB and up", Brian Crown commented. "The new EEC regulations define an upper limit of 55dB and subjectivity has no place in determining whether a printer conforms to a precise figure. As far as we are concerned there is only one way to be objective, and that is quantitative measurement using a decibel meter. Then you can really see what sort of a job a printer silencer is doing".

The lid is made of clear or smoked-finish Plexiglas. Crown Acoustics (CW), 55a Chigwell Road, South Woodford, London E18. Tel: 01-989 9096/7.

Product confidence is also reflected in the company's philosophy on loan demonstration units. For larger users, say ten and up, Crown Acoustics is willing to loan a unit on a week's free trial. Thus the prospective purchaser has time to see how effective the silencer is (perhaps even alongside a competitive product).

The Crown Acoustics range includes over 250 desk-top and floor-standing models covering most available printers. All are fan cooled.

The objection raised by some users that silencers make it awkward for operators is overcome by proper space design and the use of double "memory" hinges for the lid.

The lid is made of clear or smoked-finish Plexiglas.

Crown Acoustics (CW), 55a Chigwell Road, South Woodford, London E18. Tel: 01-989 9096/7.

41 Mbytes on 8in Winchester drive

MICRO Technology, represented in the UK by Unit-C has developed two DEC-compatible Winchester controllers that emulate the DEC RL01/RL02 disc drives, but with the fully optimised storage capacity of standard Winchester disc drives.

The MLV11 provides 41.6 megabytes of storage on a single 8in Winchester drive. The MLV11M provides 20.8 megabytes of storage on a single 5 1/4in Winchester drive, or 41.6 megabytes when multiple drives are used.

An innovation in recording techniques has made it possible to overcome the storage capacity loss of other emulators that interface Winchester drives with DEC equipment.

Both the MLV11 and MLV11M are totally compatible with DEC hardware and software and are designed for use with Q-bus computers. Both controllers can be interfaced with single or multiple drives, and both are dual-height, single board controllers requiring less space and power than larger, less sophisticated systems.

The MLV11 and MLV11M feature user-selectable media de-

napping, transparent error correction hardware, and an internal crystal-stabilised phase-locked loop to assure complete data integrity.

Both new controllers plug directly in the Q-bus backplane making the changeover from RL01/RL02 drives to greater capacity Winchester drives an easy operation, says Unit C.

EUROPEAN PRESS

A widely-held belief is that the trade Press across the Channel is academic beyond reason, its editorial diet intelligible only to professors . . . Jeremy Woolfe puts the record straight

Exploding the myths that still cling to the computer Press

THE software engineer was English, had worked on a contract basis in and around London for seven years and was currently engaged by the Société Générale Belge bank as part of a team in Brussels, updating the bank's cash dispensing system.

He knew his job well, earned a generous remuneration and read *Computer Weekly*. I asked him what he thought of the computer Press in continental Europe.

"What Press? Is there one?" he asked.

Unfortunately, this epitomises the management that should know better.

The opinion is not only totally false, but it is also rather damaging. It often results in extremely feeble use of a potentially powerful communications tool - the continental computer Press - that is potentially available to the UK computer industry, wishing to export to its largest and closest export markets, ie the markets in Europe.

The truth of the matter is that the computer Press in Europe does exist and is powerful. Yes, it is true that some publications are highly dull. You know the sort of thing: typesetting is by typewriter. And printing apparently takes place in a day when ink is in short supply.

There are no good pictures, but each third paragraph is followed by a mathematical equation. The author, professor or engineer, works full time at some unknown university and probably does not leave it very often.

But these publications are quite untypical. The computer Press in Europe can accurately be described as vigorous, prolific, professional, fast developing, varied and serious. At times it can even be slightly amusing. It is often clever. It is certainly read and respected.

Many publications meet this description. In deciding exactly how many, it is difficult to know where to draw the line around what precisely is a computer publication.

A country like Germany, say, might have a good 10 mainline weeklies and monthlies given over entirely to the world of computing. Continuing with the example of Germany, there are rather more than another 10 publications dealing with automation and instrumentation and at least 15 devoted to electronics.

And all this is quite apart from the general industrial Press, which also takes the computer industry seriously, carrying regular non-specialised articles on computer applications and so on.

Of course, this profusion should just be surprising when you think for a bit. Germany's population of 61½ million is over 5½ million more than that of the UK and comparable GNP is higher. Also, Germans are notably avid readers of almost anything.

Reference to some of the important computer publications in Germany gives an insight into the overall picture. The three that I've chosen are *Computerwoche*, the equivalent of *Computer Weekly*, a large circulation newspaper format weekly; *Computer Zeitung*, a computer newspaper not very different but fortnightly; and an exceptionally lively monthly magazine published in Cologne and called *Online*.

The reaction of *Computerwoche* editor Manfred Hasenbeck, speaking in his office in Munich, to the accusation of Germany publishing only academic material is worth hearing.

"Seventy per cent of our readers

are DP managers, decision makers and end users. 10% are consultants and the remaining 20% are in the computer manufacturing industry. Therefore, our editorial has to include many very practical articles aimed especially at computer users," he says.

Hasenbeck could easily add that a print run of 30,000 copies an issue could hardly be supported if the contents were not clearly and articulately presented.

When you turn to the monthly magazine, you find that the cover on a recent issue of *Online* goes out to support the case that the computer Press is bright and imaginative.

This cover, picked more or less at random, shows in bright colours and marvellously vivid graphic terms a pair of hands struggling with a cubic cube.

Above, in a cartoon-style speech bubble, are the words "Softmix nervi!" (mixed software languages get on your nerves). The style of the design is pop-art and when you turn to the inside of the magazine you find contents that are clearly presented, well balanced and businesslike.

In the absence of ebullient editor Günter Sandelschep, deputy editor Horst Dahmen talks about overseas orientation and the publication's special editorial sections for Austria and for German-speaking Switzerland.

But, he says, when it comes to editorial input, very little material is sent in from the UK computer industry. "Oh yes, there's one

firm that sends in good stuff from time to time, but not much else."

You have to wonder why. Could it be that Germany is too far away? But is this really justified, when its nearest town to the UK is roughly the same distance away as Newcastle is from London?

In any case, the "distance" argument can hardly apply to France - that large chunk of land only 21 miles offshore from Kent.

Sometimes the smaller countries appear to be more dynamic per head of population than some of their neighbours. The Netherlands and Belgium bear this out. Both countries are determined to maintain high technologies in industry

France's population of 54 million, as we should be aware, takes its own computer industry with the utmost seriousness. It has to - on government orders!

As in Germany and elsewhere, the ultra-academic publications do exist in France, but you have to look for them. What hits you first are such publications as the news weekly *Ol-Hebdo* (or *Ol-Weekly*) and its only slightly more profound monthly stablemate *Ol-Mensuel* (or *Ol-Monthly*), and many others. The computer field here is one of effervescent vigour.

Jean-Marc Chabanas, editor of both *Ol*s, says that the newspaper format weekly prints 50,000 copies a time, 6,000 of which sell direct to the public in newspaper kiosks on

the streets, in railway stations, etc. The majority of readers, 70%, count as "computer users", with 20% coming in the category "software" and 10% from manufacturing. A strong "situations vacant" advertising column helps keep the circulation high.

Do the *Ol*s have an academic approach? "Perhaps just a little, as far as the monthly is concerned," says Chabanas. "Here we often use

outside writers to get the reaction of computer users to statements put out by manufacturers.

"As for the weekly, editorial reaction has to be more immediate." It should be noted that the weekly also carries special pages of interest in French-speaking Switzerland and in Belgium, and goes to the trouble of printing some matter in Flemish to suit the northern part of Belgium.

Flipping through a recent issue, you see articles on people, products, a discussion on a robot at work in the all-important French food industry, an analysis of some personal computers and, finally, 20 solid pages of job adverts.

Overall, 80% of the contents originate from within France, with much of the outside material coming from the US. The UK's contribution is around 5% Chabanas thinks.

This publication group obviously takes news "abroad" seriously. It has permanent correspondents in both the US and the UK, who control practically all the news from the "Anglo-Saxon" countries.

In other words, British industry does not even have to step across the sea to make its liaison with an important European publications nerve centre. This case is, of course, rare.

But just because the *Ol* group is strong, do not be misled into thinking that the group has a monopoly in France. In fact, the pattern is much the same as in Germany.

Picking from a chance pile on the bookshelf I came across a 190-page colour magazine called *Mesures*, *Régulation Automatique*, which has a heavy emphasis on measure, *La Nouvelle Automatique*, an issue of *Bureau Gestion*, which concentrates mainly on office micro and *Méris* and *Micras*. A more comprehensive pile might also include *La Presse Informatique*, *Bureau et Informatique* and *Informatique et Gestion*.

These publications tend to fall into two main groups. There are the mainly monochrome newspaper-style publications and the glossy covered *House and Garden* style magazines. At least this is how one computer Briton abroad, Dr Colin Jackson, expresses the general situation.

Jackson, from the Butler Cox consultancy, is an unusual example of someone quite ready to criticise Europe's computer Press. "But not for being academic!" he explodes.

"They are not learned journals at all. If anything, mundane, but it obviously varies from country to country."

In my view what they need is more in-depth writing," he says. "Sometimes the minor companies appear to be more dynamic than

the streets, in railway stations, etc. The majority of readers, 70%, count as "computer users", with 20% coming in the category "software" and 10% from manufacturing. A strong "situations vacant" advertising column helps keep the circulation high.

In Holland this writing is in the national language of Dutch - not English, as some British companies would appear to think. The same applies to Northern, ie Flemish, Belgium.

Altogether, there are about 20 million Dutch speakers in Europe, making it nearly half as important as English is in Europe. Because of the common Dutch language in Holland and Flanders, there is quite an overlap of Dutch and Flemish publications from one country to the next. Probably the strongest two single publications are the Amsterdam-based fortnightly, *Computable*, and its similar weekly newspaper rival, *De Automatisering Gids*, also of the Netherlands.

Both are newsy-looking publications with high circulations. Both give wide coverage to all aspects of the computer industry and both are highly respected.

However, when you've finished with those two publications, you certainly have not finished with the Dutch computer press. There is also a rather technical review, *Informatic*, which sells about 19,000 copies an issue.

There is also *Micromix*, a monthly, newly born this year, but already putting out 32,000 copies a time. Considering the country's population, it has almost achieved mass circulation newspaper status.

Editor of *Micromix*, Joost Boswyk, outlines his publisher's policy: "Our aim is to satisfy first-time users. We seek to give non-technical readers, such as you'd find in small businesses, information for professional use on the subject of microcomputers."

"We aim to show them what you can do with the machines, not how they work."

Micromix would appear to be an important platform from which to address an affluent audience. So, the editor of a highly read computer magazine would welcome competently written material from Ferranti, Plessey, Sinclair and other British companies with interesting developments, but they send out very little editorial

The editor of a highly read computer magazine would welcome competently written material from Ferranti, Plessey, Sinclair and other British companies with interesting developments, but they send out very little editorial

remembering the 20 million Dutch speakers in Europe, does Boswyk receive much of his press release material from the UK in the Dutch language?

"Only very rarely," is his immediate answer. He can only recall ICL as being a good exception, and that's because the material comes straight from ICL's subsidiary.

If the European computer Press generally divides into the newspaper and the glossy, there is one that seeks to bridge the gap, and that is *Data News* in Belgium.

Data News, which has editions in both French and Dutch, has a large newspaper format, coloured covers, but not much colour inside. Editor Paul Ruell himself a Fleming described the content: "On one page there might be an article on a new integrated circuit

(THE KEY * TO SUCCESSFUL SOFTWARE SALES)

Earl's Court, London.

June 5-7, 1984

software '84
EXHIBITION AND CONFERENCE

Certainly the major software event of 1984 will be **Software '84**, to be held for the first time in Central London. **Software '84** will be totally dedicated to professional software sales and will be held from 5-7 June 1984 at Earl's Court in the centre of London, the Nation's biggest commercial market place.

Such a show could only come from a company that understands the computer market. Reed Exhibitions, the country's largest exhibition organisers, will be staging **Software '84** with all the skill the company has already brought to the highly successful Compec shows.

Computer Weekly and Software* will be sponsoring both the exhibition and the prestigious conference, running at the same time, guaranteeing a high level of interest in both events.

Inevitably, top quality business visitors will be drawn to such a show, with DP professionals, dealers, OEM's and serious business and professional end-users all visiting the exhibition with nothing but software purchase at the forefront of their minds.

With that kind of captive audience you can't afford not to be a part of this important event. So turn the key to the booming software market and make **Software '84** the key to successful software sales. The first step is to fill in the coupon below:

* In association with Systems International, Practical Computing, Micro Business & Computer Talk

I am interested in exhibiting at **Software '84** ☐

PRODUCTS

Philips first with 'tele-newspaper'

CLAIMED to be the world's first 'tele-newspaper' TV has been launched on to the UK market by Philips.

The CS3890 is a 26in colour television with a miniature built-in printer which, at the touch of a button, provides a paper copy of any teletext page. Users can call up the share prices, road reports or a recipe and keep a handy copy for reference or further study away from the TV. It's also for home computer buffs who want to copy long, complex teletext broadcasts.

The printer is housed in a spring-loaded drawer to the right of the TV screen.

Heat-sensitive paper is used, and each page takes less than 30

seconds to print. Three paper rolls are supplied with the set, and each roll is sufficient for 175 pages.

Besides the printer, the 3890 boasts all the features of a luxury TV. Full remote control is standard (the sw-style slimline handset also operates any Philips Video 2000 video recorder); there is five watts of sound output into two speakers (a 4in woofer and 2in tweeter) and a microprocessor controlled tuning system with direct access to a maximum of 90 channels.

The Philips 3890 retails for about £699 including VAT.

Philips Video (CW), City House, 420-430 London Road, Croydon CR9 3QR. Tel: 01-689 2166.

Philips' 26in Teletext colour TV with built-in printer.

Streaming for DEC LSI-11 users

DEC LSI-11 users can have the same tape streaming facilities as mini and mainframe users with the new tape cartridge subsystem available from Mid Electron Systems. The LSI-50 can store up to 44 Mbytes and is fully compatible with the LSI-11.

Its 22-bit addressing capability makes it upward compatible with the new 11/23+ systems.

The subsystem consists of an LSI-50 controller - a single quad board - and a CDC Sentinel streaming cartridge tape drive which uses Win cartridge tape.

A full range of operating systems including RT-11, RSX-11, RSTS and Xenix are supported. The LSI also provides file-oriented back-up/restore operations under standard DEC utilities such as Pip, Pilex, Bru, Dup, Copy, DSC and Preserve.

Functionally emulating the DEC TM-11 tape system, the LSI-50 not only provides back-up but also serves as spooling storage or a means of loading programs.

A 32 Kbyte 'relaxation' buffer allows overlapped I/O with disc activity without requiring specialised programming.

Mid Electron Ltd, (CW), Mid Electron House, Nottingham Road, Belper, Derby DE5 1JG. Tel: (077362) 6811.

Terminal offers high resolution

A MONOCHROME graphics terminal which is claimed to offer high resolution at low cost has been introduced to the UK by Brent-Cybernet.

It provides emulation of the Tektronix 4010/4012 graphics terminals and Tektronix Plot 10 graphics package, featuring a full 1024x1024 resolution (1024x780 displayable).

Raster-scan operation is employed for reliability, which is further enhanced by the 1012 terminal's a reduced parts count.

Brent-Cybernet (CW) Sovereign House, Dallow Road, Luton, Beds LU1 1TP. Tel: (0582) 452028.

The Cybernet 1012 terminal.

Seismic software package

GOULD Electronics is offering a comprehensive seismic data software package, to be operated on the Gould IP8500 or IP8400 Image processing systems.

The Seismic Workstation Software features interactive computer graphics efficiency in the handling of seismic exploration and modelling data. It allows users,

says Gould, to view and manipulate data more rapidly than through conventional methods.

The package is a low-cost, yet fully functional utility level foundation to which proprietary software can rapidly be added.

Gould (CW), 1870 Luoddy Ave, San Jose, California 95131. Tel: (408) 263-7155.

The floppy disc boxfile from Rhone-Poulenc. Prices start at £24.50.

New way to protect floppies

A NEW filing system for floppy discs from Rhone-Poulenc Systems is said to offer a way of protecting floppies when not in use, while still allowing fast and immediate access.

Designed for use with Rhone-Poulenc Systems' 5¼in Flexate discs, the file is a rugged plastic box which opens fully to display up to 10 floppies.

Prices for the file, which is supplied with 10 Flexates, start at £24.50.

Rhone-Poulenc Systems (CW), High Street, Houghton Regis, Bedfordshire LU5 5QL. Tel: (0582) 605551.

PRODUCTS

Personal conversion for IBM terminals

A NEW model of the Avatar universal terminal converter thus transforms IBM 3278, 3178 and 3278-compatible terminals into multifunction intelligent workstations with personal computing capabilities has been introduced by ISG Data Sales.

The Avatar TC3278 is a microprocessor-based system that enables 3278/3178 terminals to retain normal functions and features for dedicated operations while adding facilities for personal computing, including local software and data storage.

The conversion enhancements offered by the Avatar are claimed

by ISG to exceed substantially those recently announced by IBM, and at a significantly lower price.

The Avatar RC3278 consists of a single board microprocessor with up to 256 Kbytes of RAM; three asynchronous serial ports for connection to non-IBM hosts, local printers and modems; and two coaxial interfaces for the 3278 and 3274/3276 cluster controller.

The system supports single or dual 5¼in floppy diskettes, or up to 1.6 Mbytes of storage, in a diskette and Winchester disc combination that offers 5, 10 or 20 Mbytes of hard disc storage.

The TC3278 comes packaged

with a CP/M, CP/M-86 or MS/DOS operating system, CalcStar and WordStar application software, and a CBasic software development system. Utility packages for data transfer, file maintenance and system configuration are also included.

The Standard TC3278 system costs about £1,620, immediate delivery. But a special model is required for dual processor conversion of the IBM 3278 terminal costing about £2,225.

ISG Data Sales (CW) Wellington Industrial Estate, Spence Wood, Reading RG7 1AW. Tel: (0734) 884666.

The System 1500 from Spectragraphics Corporation which can support up to 64 workstations.

New concept in computer graphics

DESCRIBED as a new concept in computer graphics workstations, the System 1500 Multistation from Spectragraphics provides a range of interactive graphics features.

The controller supports from one to four workstations, and when configured with a 'communications controller', the 1500 can support up to 64 workstations.

It is also offered with a choice of 32-bit parallel interfaces for IBM, Perkin-Elmer, and Digital Equipment host processors.

The System 1500 is designed to accommodate the more demanding graphics applications such as CAD/CAM, signal processing, seismic interpretation, command and control, simulation, mapping and molecular modelling.

Prices for the System 1500 controllers start at \$21,900. Up to four workstations can be added to the controller.

Spectragraphics Corp (CW), 10260 Sorrento Valley Road, San Diego, California 92121.

Data Type's XK19 high resolution graphics terminal.

19in screen graphics

A LOW-COST graphics display terminal with a 19in screen, announced by Data Type, is the latest addition to the Data Type AutoGraph family, and will cost from £3,750 with deliveries starting in the next two months.

The XK19 is aimed at the CAD/CAM market where, says Alan Richardson, sales manager for Data Type, a 19in screen has now become 'the standard for design applications'.

Data Type has also introduced joystick and bit pad input for the XK19 and the other AutoGraph graphics terminals.

The XK19 provides the same

1024x780 viewing window as the Tektronix 4014 terminals, on a long-persistence P-33 green phosphor tube. The terminal's 1024x1024 image memory format provides 'square' pixel spacing for 'screen dump' output printing on the new generation of matrix printers. The user can choose between green-on-black or black-on-green displays.

The XK19 features on-board intelligence for drawing circles, arcs, ellipses, and in-fill for blank areas.

Data Type International (CW) 104 Llantrann Industrial Park, Cwmbran, Gwent NP44 3YP. Tel: (06333) 69162.

Floppy disc library case

A UK-built floppy disc library case claimed to be superior to US rivals has been introduced by DRG Business Machines.

The case, a one-piece plastic moulding, is said to be easier to open than competitors.

Three standard colours are available: blue, black and beige. Special colours can be provided to meet customers' specific needs on big orders.

Initially the cases are for 5¼in discs only. An 8in version will be available soon.

DRG Business Machines (CW), 13-14 Lynx Crescent, Winterstone Road, Watton-super-Mare, Avon BS24 9DN. Tel: (0934) 415398.

Data logging device

A DATA drive from Quality Systems International, called the QS121, is a dual magnetic cartridge system designed to communicate with the host computer through a standard RS232 interface.

The command repertoire includes read/write/copy/delete/rename/back-up/verify for sequential file handling and read/write/copy blocks of 256 bytes, for random processing and directory housekeeping.

The one-off end-user price is £795, excluding VAT. Quality Systems International, (CW), Imperial House, 108-110 New Walk, Leicester LE1 7EA. Tel: (0533) 343553.

SOFTWARE ENGINEERS - COME OUT OF THE DARK and BREAK INTO TELECOMMUNICATIONS

South-East c. £10,000-£12,000 p.a.

DEVELOP VAX/IBM SUPPORT TOOLS

- AMDAHL V8 PL1/TSO/ISPF/MVS
- VAX 11/750 Pascal/Basic/VMS

Why don't more recruitment advertisements answer the questions you would like to ask?

More often than not because the company concerned is worried that you may not like their answers.

We have no such fear — we are representing one of the most profitable and technically advanced companies in the world. The positions we are recruiting for will provide vital support for one of the most eagerly awaited telecommunications projects of the future.

Currently undergoing extensive software design, development and adaptive engineering, the project is capable of transforming the field of voice and data communications.

Reporting directly to an enthusiastic young technical manager you will be working within a group whose responsibilities include developing new software tools (and enhancing existing ones) to meet the project's requirements.

Information Processing People

Specialist Recruitment Consultants

20 Kensington Church Street, London W8 4EP
Telephone 01-938 1804 Telex 27861

In house training will develop your technical and personal skills. Your career path can develop along supervisory or technical lines — depending entirely upon your ability and aspirations. You will work within a secure yet stimulating environment:

- 70% increase in profits from 1982-1983
- Millions r & d investment
- High salary and generous benefits package
- Relocation assistance where appropriate

If you want to improve your standard of living, increase your technical expertise, and progress as a specialist or team leader within one of the world's most successful high technology companies ... apply now by telephoning: Marc Zundel on 01-938 1804 (or 01-602 0685 evenings/Saturday mornings) or write with brief career details quoting ref. M.Z.

SCOTT WILSON KIRKPATRICK & PARTNERS

COMPUTER PROGRAMMER

We are a major firm of internationally operating consultant civil and structural engineers and transportation planners. We require a programmer to join our in-house computing section.

The candidate must have an HNC/H Tec qualification and at least one year's experience in Fortran programming. He/She will be involved in the development and maintenance of computer aided design and draughting software.

Candidates must be willing to travel overseas for short or long terms if required. DEC, VAX and graphics experience would be an advantage.

We offer flexible working hours, luncheon vouchers, group health scheme and a salary dependent on experience.

For application form please write to or phone: Miss Deborah Pond, Scott Wilson Kirkpatrick & Partners, Scott House, Beasing View, Beasingstoke, Hants RG21 2JG. Tel: Basingstoke (0256) 61161.

SYSTEMS SUPPORT SERVICES LTD.

Station House
Harrow Road, Wembley

Programming - with a difference.

At Hambro Life we have a refreshingly different view of what application programmers should be doing.

We think they should be more than just coders. We believe a strong technical Programming Department is essential for the design and implementation of the computer systems which are so central to the administration of our business.

As a result of this philosophy we are building an extremely strong and professional Programming Department which offers unlimited growth to programmers wishing to build technical careers.

Central to our applications software development is the use we make of IBM's database management system IMS - for example we have a network of logically related databases consisting of over 70 million segments. (Our IBM 3081 runs with 3380 discs using Xerox laser printers.)

But Programming at Hambro Life is also different because the company's different. Not content with its position as the country's largest unit-linked life company, and one of the top 100 companies in the U.K., it is now embarking on a programme of

diversification and expansion that offers growth opportunities for everyone.

All this activity means that we need more high-quality programmers to join our young professional team. We need people at a variety of levels, with salaries ranging from:

£12500 up to £15000 plus car

We are looking for people with at least 4 years solid application programming experience, preferably in an IBM PL/1 environment (but we frequently retrain COBOL users).

Starting salary will naturally depend on your experience, ability and potential. In addition, our first-

class benefits package includes non-contributory pension, profit-sharing and share option schemes, free life cover, BUPA, and generous assistance with moving to this attractive part of the country.

Send now for our explanatory Programming booklet and an application form, or phone **Linda Hobbs on Swindon 46700.**

Please send me your Programming booklet and an application form.

HAMBRO LIFE

One of the top 100 companies in the U.K.

Join the Digital Research performance growth path

At Newbury and at £20,000 plus.

DIGITAL RESEARCH

The creators of CP/M™

Digital Research is the world leader in its field. It sets the industry standard, on both sides of the Atlantic, in the design, development and marketing of operating systems, languages and graphics software for microcomputers.

Its Northern European Marketing Operation, based at Newbury, is entering a key phase, with massively increasing sales throughout its territory and product launches imminent for a number of further breakthrough developments in software technology.

It therefore needs to expand its sales and support teams by adding the three people for whom you see job specifications on the right.

Digital Research combines one of the highest growth rates in the industry with one of the lowest staff turnover rates.

Your career opportunities with the Company would be exceptional.

The age group envisioned is 25-35 and the key word is energy. In each case, a degree level education should be part of the applicant's background.

Gross salary, commission and bonus (where appropriate) for each of the three posts will exceed £20,000. Plus 2-litre car, BUPA, pension, life insurance and relocation expenses.

Please apply, with curriculum vitae and in writing only to:

Secretary to the Director, Northern European Operations, Digital Research (UK) Limited, Oxford House, Oxford Street, Newbury, Berkshire RG13 1JB.

DISTRIBUTOR SALES MANAGER

A man or woman who is already experienced in the sale of computer software to the distributor and is now ready to assume responsibility for the marketing and sales of all DR products via distributors throughout Northern Europe.

You will be participating in perhaps the most exciting ever development in consumer orientated software mass marketing, and with the market leader.

An aggressive and innovative personality is needed to implement new marketing programmes and convert them into hard sales.

OEM SALES REPRESENTATIVE

An experienced software sales individual who will be responsible for penetrating existing accounts with new CP/M products and with an emphasis on the development of new business.

You will be a strong personality with an in-depth knowledge of our marketplace and the ability to negotiate contracts at the six figure level with UK microcomputer manufacturers.

You will be joining a team that is driving the microcomputer industry through unprecedented advances in CP/M software technology.

SOFTWARE CONSULTANT

A professional with a thorough understanding of language compilers and a working knowledge of real-time multitasking operating systems.

Your qualifications will be of the highest calibre.

The ability to present complex ideas with clarity and authority is essential. You will be involved in negotiation and consultation at all levels with client companies.

A strong bias towards systems languages, especially C, will be a distinct advantage, together with a familiarity of Digital Research's product lines.

154691

INSTITUTE OF GEOLOGICAL SCIENCES COMPUTING CO-ORDINATOR

The Institute has a vacancy for a Computing Co-ordinator at its Edinburgh offices where a PRIME 250 computer is operated on behalf of the Department of Energy as a satellite of a major installation in London and where a Data Base related to geological and geophysical exploration of the UK Continental Shelf is currently being installed.

- The successful candidate will be responsible to the Head of Unit for:-
1. Operational management of the PRIME computer and associated peripherals, including digitising and plotting facilities.
 2. Supervision of contract Computer Programmers and operators.
 3. Management of IGS digitising staff.
 4. Completion of new programs and development of existing programs, particularly those relevant to the Unit's digitising work.
 5. Preparation of computing resource estimates for future developments and implementation of approved proposals.
 6. Co-ordination of the work programme with the Data Manager of the Hydrocarbon Unit and close collaboration with the Department of Energy's staff.

Applicants should have a post-graduate degree in a relevant subject and at least 5 years' computing experience.

The successful candidate will join at Senior Scientific Officer level (E8, £970-£11,476 p.a.).

NERC is not a government department but conditions of service are similar to those of the Civil Service.

For further details and an application form, write to General Administration (Recruitment), Institute of Geological Sciences, Nicker Hill, Keyworth, Nottingham NG12 5EO.

Closing date for receipt of completed application forms is 30 September 1983.

Please quote reference SS/HC/ED/1.

NATURAL ENVIRONMENT RESEARCH COUNCIL.

154671

PROGRAMMER COBOL

to £9,000

An opportunity has occurred for a Programmer with a Smith London organisation utilising VAX 11/780 for the development of large database systems. They require around two years' commercial applications experience using any structured COBOL, VAX COBOL being especially welcome. Flexi-time working, bonus and cheap pension scheme go to complete the company package.

ALL LEVELS ICL 2900

to £11,000

A rapidly expanding Essex-based company has requirements for Analysts and Programmers through to Team Leader status. ICL experience which may include VME exposure is particularly relevant and at senior levels proven analysis or supervisory skills are necessary. Handling a large volume of the London insurance market, our client would especially welcome financial and insurance applications backgrounds. Benefits include profit share schemes and excellent promotion prospects.

ANALYST/PROGS & PROJECT LEADER

to £15,000

Vacancies occur at various levels for persons with good BASIC, BASIC+, FORTRAN or similar programming backgrounds, preferably backed by working experience in a DEC environment. A proven project exposure involving the building of software for banking systems, data communications or message switching applications is desired as our client has a heavy commitment for development and support in all three areas. An attractive salary range, reviewed at six monthly intervals, supplemented by a generous company benefits package is offered.

ANALYSTS ICL 2966

to £12,000

A major manufacturing company, based in Hampshire, utilising ICL 2966 under VME is seeking several Analysts to augment its development teams. A commercial or financial applications background is required and exposure to ICL hardware is desirable. Every opportunity for advancement is available to Analysts with two or more years' experience within this market leading company.

ANALYST/PROGS BURROUGHS

to £11,500

C. London company is currently looking for Analyst/Programmers to join their expanding team working on a variety of financial applications. Applicants should have around three years' COBOL to include 18 months' exposure to BURROUGHS systems. Any CMS experience will be of particular interest to our client. Successful candidates will enjoy a good deal of client contact and must be professional in both appearance and attitude. Good prospects and working conditions are offered.

SALES SUPPORT LONDON

£14,000+

Expanding company are seeking experienced DP personnel to join their sales/sales support team. Applicants will probably have spent around eight years in DP, preferably with a manufacturing or accounting applications background, together with some pre- or post-sales support exposure. They should also have feasibility study and project management experience. As well as an excellent starting salary, benefits include a company car or generous car allowance, profit share and an interesting and challenging position.

PROG & SNR PROG HP 3000

to £11,000

Software house with an excellent reputation in the HP market seeks a Programmer and Senior Programmer due to planned expansion. The senior position requires three years' COBOL with knowledge of IMAGE and VIEW and the junior around 18 months. This is a good opportunity to work on a variety of projects and applications and for the senior the possibility of moving into analysis at an early stage.

ANALYSTS C. LONDON

to £15,000

We have been retained by three London-based companies to find Analysts with varying levels of experience. A sound DP background is required with exposure to pension, payroll, insurance or accounting applications. Two of the positions are particularly interesting as they offer the chance for the Analysts to work in a consultancy role with a good deal of client contact. As well as good starting salaries perks are varied and include annual bonus and mortgage subsidy.

GSD PROG/ANALYSTS RPGII/RPGIII

£NEG

We have many clients, all SYS 34 or SYS 38 users, who have current requirements for Programmers and Analysts. Applicants should have a minimum of six months' RPG gained in a commercial environment through to three years' + for the more senior consultant positions. The companies range from banking to manufacturing and offer a wide variation of benefits.

Working Together

Effective management identify the needs of its team members and ensures that they provide the correct environment for them to function and participate. Certainly, we as a computer manufacturer follow this theme through in our management style, but more particularly we recognise the need to understand our customers' business and translate this into providing complete solutions to their problems. This commitment in working together with our existing and prospective customers precipitates our need to identify experienced analysts and programmers, enthusiastic and flexible, who wish to contribute to the overall selling cycle.

Specifically you should have a COBOL or BASIC programming background and have exposure to IBM, BURROUGHS or ICL hardware. If you have previously been engaged in a supportive or training role this will be seen as an advantage - you will not necessarily be working for a manufacturer or service company currently - but you must seek the type of environment which is always stimulating, changing, and guaranteed to keep you as "busy as a bee".

Vacancies currently exist in the MIDLANDS, NORTH WEST, NORTH EAST, SOUTH WEST, SOUTH EAST and LONDON. We offer a five figure salary, company car and attractive fringe benefits.

CUSTOMER SUPPORT CONSULTANTS FOR CULLINET

£13,000+CAR+BONUS

Whatever the question in computing nowadays, the answer is software. And software is Cullinet.

Cullinet, the world's leading independent software company, is growing its U.K. operation. This operation is responsible for the marketing and support of software products including, among others, database management, applications, decision support systems and personal computer software packages.

We have just moved to prestigious new offices in Stanmore and need the following people to help us grow even faster.

Technical Support Consultants - London

Providing day to day support for mainframe systems software products. Candidates should have at least 18 months' IBM experience with a sound working knowledge of MVS or DOS/VSE, a high level language, database management system and TP monitor.

Field Support Consultants - London and Manchester

Responsible for providing individual Cullinet clients with an advice and guidance service.

Candidates should have IBM mainframe experience at programming and/or systems analysis level. Knowledge of database management systems and a TP monitor is required.

Personal Computer Software Consultant - London

Cullinet's new range of PC software for IBM PC allows full integration of mainframe and micro applications. Applicants should have programming experience using the IBM PC with PC-DOS and be familiar with 'C'.

Please write enclosing C.V. to:
Phil Dyer, Cullinet Software Ltd.,

PL/1 PROBLEM SOLVERS

If you're the kind of problem-solver we are looking for, we can promise to introduce you to some programming puzzles that will stretch your mind and imagination - not to mention your career horizons!

The client we will want you to meet is a professional computing group some 300 strong with ambitious plans to expand over the next few years.

Check your experience against the following specs. ...

PL/1 Programmers To £10,000 p.a.

If you have 18 months or more experience in a maintenance and/or development environment this could be your chance to join a mainline development team. Training in IMS will be provided.

Senior PL/1 Programmers To £12,000 p.a.

This is an opportunity to upgrade your career to date. The position offers the opportunity to assume both project and/or staff responsibility. The main entry requirement is a good programme development background.

Software Group Leader To £15,000 p.a.
Software Design Consultant To £15,000 p.a.

If you have 5 years PL/1 experience and a talent for good design in either a commercial or technical environment these positions carry with them a high level of technical management and/or consulting design responsibilities, and will provide the kind of challenge you have probably been missing!

The company is located in custom built offices in Hertfordshire approximately 30 miles out of London (commuting is possible) and programming groups have at their disposal a wealth of computing power including AMDAHL V8, 4341, 370/158 under MVS and VM, supporting IMS and SPP.

In addition to highly competitive salaries there's a weighty benefits package including full relocation where applicable.

Interested? Then contact Colin Hinch or Jack Cowdy on 01-938 1804 office hours to 6.30 p.m. for a preliminary discussion.

Systems Programming for YOUNG GRADUATES

You're young (early twenties), have graduated in Computer Science or a relevant related subject, and have around a year's experience which, perhaps, has not quite matched your expectations. You somehow don't see yourself as a super-coder with little else to offer.

Well, here's some food for thought.

The Stock Exchange provides essential information systems to its members as well as meeting an ever-increasing demand from outside organisations, and is considered to be in the forefront of viewdata technology and real-time information services.

We are now seeking three young graduates for Information Systems Development who will work in teams involved in the programming of these real-time systems. The work is extremely varied, covering many new projects and implementation is seen after a relatively short period. Most projects include communications or database work.

You will be an integral part of one of these teams. However, when your task has been outlined, you will propose a strategy and will be responsible through to coding and ultimately provision of documentation.

We are looking for good communicators with some programming experience in a high level language. If this has involved real-time interactive database systems and/or communication systems on minis or micros, so much the better.

Initially, the term of employment will be for a period of two years. The salary will be around £7000, depending upon experience, with an end-of-term bonus. Additionally, the benefits include a fully-paid season ticket scheme, subsidised lunches and flextime.

Please apply with a full curriculum vitae to: Jen Ross, Personnel Officer, The Stock Exchange, Old Broad Street, London EC2N 1HP.

The Stock Exchange

The IBM SYSTEM/34/36/38 Recruitment Specialists

IBM SYSTEM/34 ANALYST/PROGRAMMER TO £13,000 + BENEFITS BERKSHIRE

We are a multinational corporation engaged in the design, manufacture and marketing of electrical and electronic components and systems.

Our European headquarters is based in Berkshire and we have a worldwide annual turnover in excess of 270 million dollars. There is a System/34 based in the UK and in five of our ten European divisions. Two more are soon to be installed, one in the UK and one in our Spanish division.

Planned expansion and development is in progress and will be for the next few years. We need an experienced Analyst/Programmer to help us realise our requirements. Ability and experience in the design, programming and implementation of System/34 applications is necessary and knowledge of MAAPICS an advantage. European travel is envisaged so good communications skills coupled with diplomacy and in all instances the capacity for self motivation and hard work is needed.

Please telephone for an early informal discussion our Advising Consultant, Richard Milsum, on 01-354 1055 during office hours or on 01-958 2553 in the evenings or weekends. Alternatively please send full details to him at:

JOIN THE ELITE

—ideally with engineering or manufacturing systems experience

Someone experienced in systems development is needed.

Our client, a major IBM user, wishes to fill the new position of Systems Project Leader in their growing Management Services Group. They are looking for someone with good all round systems development experience. Someone who has worked in an engineering or manufacturing systems environment would be a particularly suitable candidate. However, more important is the ability to cope with both systems and people in a pressurised environment.

You will probably be in the age range of 28 to 35, and have a successful track record in systems development stretching over a period of at least seven years. You will believe that you can contribute significantly to an expanding systems group and will enjoy the rewards this brings both in financial and personal terms. Although you will be joining an established team, you will be given every opportunity to make a major contribution to the continued expansion of Management Services within the company.

Our client has achieved leadership in their field by offering services that are second to none. Computing has played a major part in achieving this high standard! Their expectations are high and they are demanding employers, but the career opportunity presented is well above average and will certainly excite someone ready to move up quickly.

If you are anxious to develop your career significantly then send your curriculum vitae to A & A Consultants (Holding) Ltd, County House, 10 Little Portland Street, London W1N 5DF. Telephone 01-631 4184. Please quote Ref. No. 404.

DALROTH

SAUDI ARABIA

Microprocessor Engineer

c.£9,500 South East

A leading manufacturer of sugar confectionery, my clients have successfully introduced INTEL Microprocessors to their manufacturing processes over the past 5 years. If you are a Graduate Engineer with experience in Real Time Industrial and Process Control Microprocessor Systems, a challenging position awaits with a small team, engaged in keeping this company in the forefront of current technology. Please write, including full CV to: Anne Jolin, PER, 5 London Road, Maidstone, Kent.

Executive Selection

Systems professionals

Even if you like it where you are, we'd like you to read this.

No matter how successful you are in your present job, there are many reasons why you should consider a move to Hambro Life.

So many, in fact, that we've spelt them out in our Systems booklet:

Once you've read it we know you'll want to be part of the exciting future at Hambro Life.

If you've been reading the Press over the last few months, you'll know that there's no where more healthy than the financial sector. And there's no company within that sector growing, diversifying and succeeding faster or better than Hambro Life.

Right from the beginning, computer systems have been central to our success — and with all this activity sweeping through the company, our Systems Department is expanding and developing like never before.

All of which means that we need more first-rate Systems professionals to join a team that is second to none.

The job given to you — and the salary it carries — will naturally depend on your experience, ability and potential. We have vacancies at

a variety of levels, earning salaries ranging from:

£13,000 plus car

(for a minimum of 4 years Solid Systems experience) up to

£18,000 plus car

Because Systems feature so highly in our success, the people we recruit have to be something special.

You must be bright and clear thinking, aware of the business implications of what you do, with good communication skills and the ability to cheerfully combine pace with quality.

Your professional skills are more important to us than the

which they were acquired, and your experience in large-scale systems and record of successful implementations will reflect the qualities we demand.

On top of salary and car, all appointments carry a first-class benefits package including non-contributory pension, profit sharing and share option schemes, free life cover and BUPA — plus generous assistance with moving to this attractive part of the country.

That's Systems at Hambro Life in a nutshell:

But if you'd like the full story, return the coupon. Or call Linda Hobbs on Swindon (0793) 46700.

Please send me a copy of your Systems booklet and an application form.

Name

Address

Post to: Linda Hobbs, Hambro Life Assurance plc, Hambro Life Centre, Station Road, Swindon, Wilts. SN1 1EL.

HAMBRO LIFE

One of the top 100 companies in the U.K.

Software Specialist c. £12K

Timex have achieved rapid success in high-volume consumer based electronics — they lead the home computer market in volume production — through technologically advanced development and manufacturing programmes. With major financial re-investment and further new products to be on-stream shortly, they require a Software Specialist to grow with them.

Reporting to the Chief Electronics Engineer you will be the software kingpin in design and development — supervising and advising on all software activities as a project team member. With an R & D or Design and Development background, you should be of graduate status, capable of working with 280 assembler code. BASIC and/or FORTRAN an advantage.

Hill Briton,
Victoria Chambers,
42 Frederick Street,
Edinburgh EH2 1EX.

Considerable experience within volume electronics assembly is essential; experience of micros as applied to peripherals, an advantage. The company also have vacancies within its Test department for graduate qualified engineers.

Chief Test Engineer c. £13K — to manage a team of Hardware and Software Development Engineers. High-volume electronics manufacturing experience essential as is knowledge of latest developments with A.T.E.

Test Engineers c. £9K — to develop equipment, determine procedures and write A.T.E. programmes. Related experience in high volume manufacturing, a distinct advantage. For further information on the development opportunities at Timex on Tayside, please contact Consultant, Tim Doyle on 031-224 6113.

DALROTH

LONDON BASED BASIC SALARY £ NEGOTIABLE

Dalroth & Partners is one of the leading international recruitment organisations with assignments currently in the Middle East, Europe and the USA, the majority of which are undertaken on an exclusive basis from initial definition of job specification through to assistance with shipment of families and their effects for many of the overseas appointments.

Consultants joining us at the present time should be capable of assuming full responsibility for recruitment assignments and will be encouraged to build client relationships leading to total account management.

Activities include job and person specifications, advertising copy/layout/placement, screening/shortlisting from advertisements and computer-based candidate files, reference checking, visas, etc.

Currently there is great scope for client development in the UK as well as abroad for both permanent and contract appointments.

Essential is the personality and determination to establish successful client relationships. Experience in either a DP or recruitment environment combined with a Sales/Marketing background would be ideal.

An excellent package will be offered, the format of which is negotiable.

For further information please contact either Roger Allington or Jenny Delrymple-Hey, day on 01-483 2947 or weekends respectively Little Gaddesden (044284) 3636, Beeconsfield (04946) 4579 quoting Ref. 5008.

Programmers near Guildford

Our client is a Software House, specialising in financial applications to run on IBM or DEC equipment. They are currently expanding rapidly and wish to recruit programmers who either have experience within a Software House, or would welcome the challenge provided by this type of environment. You will be required to spend some of the time on clients' premises, which could involve you in time away from home. You will work on both batch and on-line systems, developing programs interactively. Sometimes you will be working in a team and on other occasions you will be required to stand on your own feet as the company's sole representative. In addition to the skills you bring with you, you will acquire others—in particular on micro-computers.

Please contact Joan Ainsworth on 01-681 8311 or write to her at Carolyn House, Dingwall Road, Croydon, Surrey CR0 9XF.

IBM-GSD c.£11,000

We are looking for at least 3 years' experience of programming, which must include a substantial amount of time spent on IBM-GSD equipment using COBOL and/or RPG.

DEC-BASIC/COBOL c.£11,000

This requirement is also for a minimum of 3 years' programming experience, gained in a commercial environment, which must have given you in-depth knowledge of some DEC systems, using BASIC and/or COBOL.

Computer Search & Selection

Head of Technical Support Croydon

This key position will appeal to a Systems Programmer who would welcome the opportunity to assume responsibility for a small team of Systems Programmers and Data Administration Staff, within an expanding installation. In addition to supervisory skills the job requires the ability to liaise with operations, users and suppliers in order to investigate, and advise upon, the relative technical merits of hardware, software, packages and

- Immediate Subsidised Mortgage
- Non-contributory Pension
- Free Life Assurance
- Subsidised Lunch
- Flexitime

related products. You will also be required to provide some in-house education/training for your own staff and users. A major requirement from the department is the provision of technical guidance and support to applications teams.

Please contact Joan Ainsworth on 01-681 8311, or write to her at Carolyn House, Dingwall Road, Croydon CR0 9XF.

Computer Search & Selection

Programmer Stratford, London E15

Career development prospects with a leader in commodity trading

The Brooke Bond Group is a successful international business engaged in the marketing and distribution of tea, coffee, meat and other food products: the importing, processing and distribution of timber and allied products, the operation of plantations and ranches, commodity trading and specialist manufacture and services in the printing and microbiological fields. The Group's commodity trading business in the UK is based in Stratford, London E15. A DEC PDP 11/44 computer has recently been installed to handle the accounting and stock control functions. Computerisation of other aspects of the business will follow.

This is an interesting career development opportunity for a Programmer with at least two years' experience in BASIC+2, RMS and RSTS/E gained in a commercial environment. Ideally, candidates will have experience of telecommunications and in the operation of a PDP 11/44 with RMO2 disc drives. As well as a competitive salary and pleasant working environment, there are genuine prospects of promotion. The job also offers a measure of security with this major international business. Further training will be made available where required. Ring Basil Lansdale, Personnel Manager, on 01-248 6422 for an application form or send him a brief career profile including current salary.

Brooke Bond Group plc, Thames House, Queen Street Place, London EC4R 1DH.

SOFTWARE DESIGNERS

... super challenge ... young team ... south coast

To £14,500 + Benefits

My client is one of Europe's most impressive and fastest growing electronic companies and is based in an attractive south-coast location. With American parentage the company is achieving rapid market leadership with high profitability and major investment in advanced micro-technology.

This is a new and exciting opportunity for high calibre SOFTWARE DESIGNERS/PROGRAMMERS/ENGINEERS with some 2 years experience in one of the following:-

- ★ Real-time microprocessor systems
- ★ High-level languages e.g. Pascal (for developing applications software)
- ★ Assembler

Appreciation of electronics with an understanding of 8 bit microprocessors (6800 family) or RSX-11 based systems would be an advantage.

Build on your software/firmware programming experience to become involved in this young dynamic multi-disciplinary team to achieve technical and management rewards within a fast moving success orientated company based in an attractive south location.

Starting salaries to £14,500 + Benefits.

Contact Shakeel Ahmed B.Sc.

To discuss your microtechnology future call Shakeel Ahmed B.Sc. on Windsor (07535) 56155 or write to us at:
Kramer Westfield Associates Ltd, 23 Victoria Street, Windsor, Berks SL4 1HE.

Kramer Westfield

Commercial Director Surrey

Our client is a new software house, which is part of a group that may be fairly described as a "household name." The company will be providing a wide range of solutions to business problems, including consultancy services, bespoke software, applications packages and hardware (both mini-and-micro computers) within specific vertical markets. It is intended that these markets should be Property Management, Commodity Broking and Export Shipping.

c.£22,000+Car

We are looking for a very experienced consultant, used to running project teams and being involved in pre- and post-sales activities, who would welcome the opportunity to make their own mark on the company, by being involved in its strategic development. A further responsibility will be the administration of the company. Early tasks will include the recruitment of professional staff and "hands-on" consultancy. It is considered that anyone under 35 will not have had sufficient time to acquire the degree of business acumen and wide-ranging practical experience, required for this key appointment.

Please send a detailed cv to Joan Ainsworth at Carolyn House, Dingwall Road, Croydon, Surrey, CR0 9XF.

UNIVERSITY OF LONDON
GOLDSMITHS COLLEGE

APPLICATIONS/ADVISORY PROGRAMMER

Applications are invited for the post of Applications/Advisory Programmer to start as soon as possible. The Computer Centre is recently established and provides a service to a wide range of academic and administrative users of the College VAX 11/750.

The advisory service supports computing on the VAX as well as the link to the University of London Computer Centre and work on a number of microcomputers. We are looking for an adaptable person to give advice to all members of the College and to work on a wide range of new programming projects. There will be an opportunity to specialise in one or more of the following areas: - graphics/computer art, statistics, information retrieval, computer aided learning and computer literacy. Applicants should preferably be graduates with experience of programming but non graduates with good programming skills and experience will also be considered.

Salary within the range £7,277 x 6 increments to £9,288 per annum inclusive. Write for further details to the Personnel Officer, University of London Goldsmiths College, New Cross, London, SE14 6NW. Closing date for receipt of completed application forms 23rd September 1983.

SYSTEMS PROGRAMMER

A position of increasing scope
£12,500 City

This is one of those rare appointments where the job will grow in line with your capabilities.

A major name on the international scene, our client is committed to advance through automation and is implementing ambitious new development plans in the commercial sector, based on dual PDP11/70s supporting 50 remote and local terminals.

From Day 1 you will be working with a good deal of autonomy, with direct responsibility to the DP Manager. You will, in effect, be the "Technical Department" with a brief to provide technical assistance to operations, the development teams, and supporting the operating system. The planned expansion of DP within the Group will lead to your involvement in the setting up of a communications network.

It's a challenging opportunity that demands at least three years DP experience to include a minimum of 18 months Systems Support on DEC software under RSTS/E.

For further information talk to Bernard Taylor on 01-930 4041 during office hours or Hayling Island (07016) 66768 evenings.

A WEALTH OF OPPORTUNITY DESIGNER/PROGRAMMERS AND PROJECT LEADERS

REAL-TIME DEVELOPMENT SOUTH COAST Package to £15k+

A wealth of opportunity for career progression, job satisfaction and skill development, together with an excellent salary, are the genuine rewards made available to ambitious and enthusiastic software professionals by the continued growth and expansion of our client. The organisation is a world leader in non-defence advanced electronics and data communications.

Ever increasing demand in home and overseas markets has created the need for additional specialists at Designer/Programmer and Project Leader levels.

As a member of a small team, you will enjoy the stimulus and challenge offered, by working on important projects in the fast growing area of communications technology. At the same time you will develop your own skills and experience. Success in these roles will naturally lead to career progression and even greater responsibility and reward.

A demanding environment such as this calls for people of graduate status or equivalent with at least three years' experience of Real-Time software. ASSEMBLER or knowledge of an appropriate high level language such as CORAL are the language requirements.

A high basic salary is offered, and there is substantial scope to enhance earnings through voluntary, paid overtime and convenient day-time shifts. A generous relocation package is available to a superb, semi-rural South Coast location which offers excellent amenities and reasonably priced housing.

Interested men or women should contact Patrick Convey quoting reference CW324.

Earn up to £23k free of tax in the Arabian Gulf Excellent conditions and package Latest hardware and software techniques

ARAMCO of the Arabian American Oil Company without doubt the world's largest oil producer has needed in one of the industry's most ambitious exploration exercises with the formation of their Exploration and Petroleum Engineering Centre with its own dedicated computer facilities. The size of this operation and its continuing development is such that there is an additional need for highly skilled manpower.

The computer centre is equipped with an advanced IBM configuration of 3033's and 3081 running under MVS JES2, VM and its associated software products and peripherals, plus a variety of other plotting equipment.

For the further development and support of their seismic and geophysical applications they are looking for the following personnel:

IBM Project Manager - c.£23k

who should have been in the data processing industry for at least eight years and have acquired diverse skills in project management and coordination and who at the same time can be responsible for staff training and career development. Some knowledge of PL/I and Fortran and familiarity with IBM software products such as SAS and VM would be an advantage. This is a responsible position which will require good communication skills and the ability to oversee and administer high level projects.

MVS Systems Programmers - to £23k

- to be involved in the system generation of the IBM configuration which utilises, amongst others, the following program products: JES2, TEC, VTAM, ACFC, HOLL, HSM, VM, CMS, MSX, SAS etc. New products are constantly being reviewed and the opportunity to become familiar with the latest techniques is a feature of these challenging positions.

Analyst/Fortran Programmer - to £23k

- to become involved in the development and support of petroleum engineering projects requiring experience of simulation software (ideally in reservoir engineering) preferably with some exposure to graphic systems.

Analyst/PL/1 Programmer - to £23k

- with experience relevant to petroleum engineering to become involved in the design, development and implementation of projects. Familiarity with a large scale IBM environment would be an asset.

A degree or HND would be preferred for the above requirements.

For full details of our current opportunities and the benefits of our location and our excellent package for a highly skilled computer professional from the following personnel:

IBM Senior Operators - c.£20k

These are excellent opportunities offering good promotional prospects for shift leaders, supervisors with at least 4 years large scale experience. Successful candidates would have worked on IBM 3033's and 3081 running MVS, JES2 or 3, TSO and other software facilities associated with a TPL network and database environment.

VAX Senior Operators - to £20k

for operation of a VAX 11/750 using VMS.

Microfiche/Printer Senior Operators - to £20k

to operate the function with the IBM 3033 printer and microfiche operation.

Senior Graphics Operators - to £20k

to supervise the operation of Bureau Van Dijk and Calcomp plotters perform quality control on displays and co-ordinate with maintenance and network operation personnel. Experience with any brand of graphics devices would be an asset.

ARAMCO is located on the Arabian Gulf and enjoys the benefits of a company operated community with splendid recreational facilities. Successful candidates can expect subsidised accommodation, free medical treatment, generous holidays and return flights to the U.K. The contract of employment is for an indefinite term and is on a single status basis.

For further information and screening interviews please contact Penny Stock on 01-836 8411 at Computer People London, VLI House, 88-88 St. Martin's Lane, London, WC2N 4JS.

European Training Instructors Salaries to £12,000

The fruit of our \$ multi million investment in European R & D is an exciting new generation of advanced information processing systems reflecting the 'State of the Art' in DDP and office automation.

A vital and yet integrated part of the marketing and support of our new products is undoubtedly our internal awareness and understanding. In recognition of this need we wish to appoint a number of additional instructors with proven experience of preparing and presenting professionally constructed courses to computer personnel, specifically Sales Executives, Software and Hardware Engineers. Of particular interest would be experience of training in any of the following:

UNIX® * ISO-COMMS * SNA * HIGH LEVEL LANGUAGES
MS/DOS® * CURRENT PROCESSOR AND PERIPHERAL TECHNOLOGY

In return for your skills we can offer career progression that will augment your existing industry knowledge with additional training in the latest computer and communications concepts. Add to this the stimulation of occasional travel to Europe and a first class benefits package and the finest training opportunities of the year are complete.

Find out more by telephoning Alan Carnell on 01-935 0671. Alternatively submit a detailed Curriculum Vitae to our London office.

R Unix is a Trade Mark of Bell Laboratories Inc.

TM MS/DOS is a product of Microsoft Ltd.

MERIDIAN CORPORATE MANAGEMENT

63 WIGMORE ST. LONDON W1. 01-486 2821

A major multi-national engineering group based to the West of London is seeking senior personnel for their technical services division

TECHNICAL SERVICES MANAGER

to £15,000+car+benefits

Our client requires a professional with at least five years' experience of IBM systems and extensive knowledge of MVS, CICS, DL/I, ACF/VTAM, ACF/NCP. You will be aware of the latest developments in the computer industry and will be able to evaluate and implement new hardware and software strategies. The ability to communicate with users and senior management, and the potential for self-development are important criteria. European and some US travel will be necessary.

DATABASE ADMINISTRATOR

to £15,000 plus benefits

You will have a COPICS (or similar) background and an extensive knowledge of the DL/I Database. Liaising closely with the systems development staff, you will provide guidelines and standards and ensure that availability, integrity and security of the Database is maintained. Already proficient, you will be looking to advance from your current position and will be seeking a career with a company dedicated to the development of sophisticated on-line systems.

MCM is an international consultancy with a background in sales, management and education in the computer industry. All enquiries are dealt with in the strictest confidence and you will be dealing with consultants who have an in-depth knowledge of all aspects of Data Processing gained at technical and senior management levels.

Telephone us now on 01-486 2821/2508 for further details

DALLAS · LONDON · PARIS · AMSTERDAM

The systems development division of a major multi-national engineering group based to the West of London is seeking two senior personnel. The company utilises IBM mainframes with MVS, CICS and DL/I.

SENIOR SYSTEMS ANALYST

to £14,500 plus benefits

Ideally you will have spent the last three years' as an analyst in a manufacturing environment and have a background in programming. It is essential that you are a good communicator and can control the development of sophisticated on-line systems. A knowledge of COPICS and Database is advantageous.

PROGRAMMING SUPERVISOR

to £14,500 plus benefits

If you have a good knowledge of COBOL programming in an on-line environment and experience of Database, this could be an ideal career opportunity. You will be responsible for a team of programmers working on a number of important projects. Liaising closely with the systems analysts you will ensure that programming standards are met and maintained. You will also have responsibility for training and the ability to control and motivate junior staff is important.

MCM is an international consultancy with a background in sales, management and education in the computer industry. DALLAS · LONDON · PARIS · AMSTERDAM

Are you making the best of all your IBM experience?

Altergo, part of Data Logic, has great career opportunities right now for Programmers, Analyst Programmers, Systems Designers, Project Leaders and Lecturers.

We want:-

- * Drive, initiative and the ability to get on with people.
- * People with large or small business systems experience.
- * For small business systems you'll have experience in System 34 and/or System 38 and associated languages RPG II and RPG III. A knowledge of DMAS or MAAPICS will be a big advantage.
- * For large business systems you'll have a knowledge of PL/I or COBOL and be familiar with a Data Base system or TP Monitor. Experience of CICS and DL/I would be an advantage.
- * For Lecturers you'll have at least 3 years IBM DP background preferably with some lecturing or other presentation experience. Some travel may be entailed.

You'll have:-

- * An opportunity to join a fast-moving company with a lot of new projects in hand and starting up.
- * A first class salary - up to £16,000 depending on experience, plus a car for the more senior levels.
- * Plus the benefits associated with a major company.
- * A working environment that treats you like the professional you are.
- * The chance of working in a company with a depth of IBM expertise that is unmatched in Europe.

What to do:-

Write to Isabel Jones, enclosing a C.V. or ring Jane Shine for an application form. Please quote ref. A001.

Data Logic Altergo Limited, Berkshire House, 168/173 High Holborn, London WC1V 7AA. Telephone: 01-379 6066.

Data Logic *altergo*

Europe's leading IBM specialists.

Programming Team Leaders/Senior Programmers up to £16k

LARGE SCALE ON-LINE AND BATCH SYSTEMS DEVELOPMENT

**CAN YOU MAKE A
KEY CONTRIBUTION?**

The success of our client's undertaking to establish their European Business Information Centre will depend on the quality of the technical leadership.

This major project provides an outstanding opportunity for software professionals wishing to take full advantage of their technical skills and rapidly progress up the management ladder.

Utilising the latest IBM hardware, with MVS, CICS IDMS, VTAM and COBOL, the centre will be one of the most advanced data processing installations in Europe. Development is based on structured analysis and design techniques.

PROGRAMMING TEAM LEADERS AND SENIOR PROGRAMMERS are required now to lead and carry through the technical development of major on-line and batch systems. You will be expected to demonstrate -

- ★ IN-DEPTH CICS OR IDMS EXPERIENCE
- ★ COBOL PROGRAMMING BACKGROUND
- ★ PROVEN LEADERSHIP ABILITY
- ★ DYNAMISM TO SUCCESSFULLY DEVELOP GROUND-FLOOR PROJECTS

If you are a programming team leader, senior programmer or have the ability to be one, then this is an opportunity not to be missed.

GENEROUS SALARIES OF UP TO £16K will be paid and excellent corporate benefits will include a pension scheme, including life assurance, private medical cover and assistance with relocation where applicable.

Please contact Ivor Brookstone on 01-637 9611

Suite 201/6 Albany House 324 Regent Street London W1R 5AA 01-637 9611

**MANAGEMENT &
EXECUTIVE SELECTION**

Dec. 17th 1903,
Mr Orville Wright achieves
the first powered flight.

What have you achieved lately?

**PROJECT MANAGERS
SYSTEMS DESIGNERS
SOFTWARE ENGINEERS
c. £16-28,000**

Do you ever ask yourself what you have achieved? Do you ever wonder why some people realize their potential while others do not? The Wright brothers realized a dream - so can you in the right environment.

This could be the chance of a lifetime to work abroad and derive all the associated benefits, and then to return to the U.K. (if you wish) with the same company with increased status and secure career progression.

The continued expansion of a leading international systems and software house has generated a number of

outstanding opportunities for real-time software specialists to develop their technical skills and improve their life-styles in a variety of European locations.

Current projects include the design and implementation of complex and highly advanced real-time defence systems and offer wide ranging and high level experience in the following areas:

Signal Processing
RADAR/SONAR
ECM
Data Handling
Assemblers
Multiprocessor
environment

Command and Control
Electronic Warfare
Fire Control Systems
MASCOT/SADT
RTL2/CORAL/PASCAL
VAN/VMS

Educated to degree level, you will need experience in some of the above areas, the ability to make an effective contribution to small highly motivated project teams and to

establish good working relationships with clients.

At a more senior level, experience of project control and management will be necessary.

The benefits associated with these international assignments are considerable over both long and short term; they can be summarized as follows:

- High salaries and generous overseas allowances
- A range of fascinating projects to increase current skills
- Assistance with all aspects of relocation
- Single or married status appointments
- Real responsibility at an early stage
- Excellent prospects both in the UK and abroad

This combination of challenging technical projects and excellent overall package will enable you to extend the horizons of your career and your quality of life.

Information Processing People
Specialist Recruitment Consultants
20 Kensington Church Street, London W8 4EP
Telephone 01-938 1804 Telex 22861

So, the first step towards an environment which encourages genuine achievements is to phone Peter Hatherley on 01-938 1804 or write to him sending a c.v.

SHAPE TECHNICAL CENTRE THE HAGUE THE NETHERLANDS

This NATO technical establishment has a vacancy for a

SENIOR PROGRAMMER

to participate in all phases of program design and development on various challenging projects including complex real-time systems, dedicated laboratory computer systems, computer networks, man-machine interface studies, military systems simulations, information systems and scientific calculations.

This post offers possibilities for variety in assigned tasks and broadening of computing experience, as well as encouragement of professional development in the Computer Science and Software Engineering fields.

QUALIFICATIONS

Education to GCE 'A' level in relevant subjects with six years' appropriate experience, or HNC with four years' experience. Sound practical knowledge of at least FORTRAN or PASCAL, together with software development utilities. Applicants must also have made a significant contribution to at least one major software project.

Gross annual salary for married personnel without children is DG. 57,300 = (tax free).

Contract will be offered for an initial one year period with the possibility of renewal on an indefinite basis.

Candidates who are nationals of one of the NATO countries are invited to send full details of training, experience and personal data to the Personnel Officer, SHAPE Technical Centre, P.O. Box 174, 2501 CD The Hague, The Netherlands, not later than September 30, 1983, quoting reference IS-B5-83.

CONSULTING ANALYST

£12,000-£14,000
NORTH HERTS.

Recent expansion has created a new opportunity within a small but demanding company for a Consulting Analyst.

The position involves working with clients and colleagues to specify, develop and implement new software systems in management information, production control and materials planning using a range of microcomputers.

The successful applicant will be aged between 25 and 40 with proven experience of microprogramming (ideally PASCAL and BASIC) and analysis, together with the ability to communicate with customers at all levels.

A negotiable salary between £12,000 and £14,000, generous car allowances, 21 days holiday, pension, life assurance, subsidised meals plus assistance with relocation, make this a very attractive package.

For further information plus an immediate local interview, please telephone:

Programmers... ... DP Auditing can offer you career development.

£9000-£12,000

ACCESS: The Joint Credit Card Company Limited, continues to grow at an exceptional rate.

Our ability to keep pace with this growth is based on an ever developing DP installation, comprising IBM 3081/3033 and 158 operating under MVS/SP with ACF/VTAM, CICS and ROSCOE with teleprocessing links to Europe and the USA, plus other peripheral hardware.

Tight control in operating our DP systems is essential and DP Auditors have a vital role to play in developing the audit procedures, using a variety of up to date techniques. Continued expansion has created several challenging new opportunities within the existing DP Audit team. A structured career path exists in the department, opening up promotional opportunities for staff with ability. Applicants should have a minimum of 3 years' COBOL programming plus general business experience.

Salaries will be negotiated according to experience, and will be backed by a valuable range of large company benefits including a non-contributory pension and life assurance scheme, 28 days holiday, free banking, loan facilities after a qualifying period, subsidised restaurant, flexitime and an excellent sports and social club. Relocation expenses will be paid where appropriate.

So if you're looking for a career move that's a move for growth, telephone or write for an application form to: Mrs Hazel Stokes, The Joint Credit Card Company Limited, Charlwell House, 365 Charlwell Square, Southend-on-Sea, Essex SS2 5ST. Tel: Southend (0702) 352266, ext. 3237.

TELECOMMUNICATIONS DESIGN AND SUPPORT

Based on the South coast, a market leader has identified a number of vacancies at various levels within the company. The positions include Systems Consultant, Principal Programmer and Programmer at all levels. Experience is required in the areas of INTEL, 8085/88, UNIX, BCPL, PL/M, X25 Talk, ASSEMBLERS, and other Real-Time systems. Obviously we are unable to detail the range and scope of opportunities within this advert but would suggest that you contact MARSHALL CLIMAN at our London office for further information. All enquiries will be treated as confidential.

COBOL REQUIRED

Two of our top clients have asked us to recruit COBOL Programmers with 1 to 3 years' experience who would be willing to train on ICL 1800/2800, VAX, and IBM SYS 38. Experience on these machines would be an advantage. A mature outlook and a desire to 'get on' in life is required. There are opportunities for travel and user contact and both companies can offer 00201027 salaries and long-term prospects that are excellent.

ICL + HP ANALYSTS AND PROGRAMMERS

A major institution in LONDON require top calibre staff for a number of interesting and varied roles within the organization. At the Analyst level applicants can expect to work under their own initiative to design and implement systems and particular importance will be attached to good communications skills as well as to directly relevant computer experience. For Programmers there are several openings with experience centred around ICL 1800/2800, DME, VME, DRS, IDMS and on HP 3000 under IMAGE. COBOL is essential. For further details please contact Marshall Climan.

ANALYST PROGRAMMERS

An international software house require Support Programmers or Analyst Programmers to help in exciting new developments. Your two years' experience on PDP or VAX with a knowledge of operating systems will be invaluable. Exposure to a communications environment would be useful and your ability to react intelligently and effectively to situations and problems will also be of value. Some travel is envisaged to implement systems and to assist users. These positions offer the successful candidate a good salary, an interesting and rewarding environment and the kind of experience that could be invaluable. Ring our LONDON office today for an immediate interview.

MIDLANDS

MAJOR INSURANCE COMPANY SENIOR SYSTEMS PROGRAMMER

£18,000 This rapidly expanding insurance company based in the City, require a systems programmer with not less than 3 years' experience in a large IBM systems software environment. You should have had exposure to MVS or OS along with extensive knowledge of INSCICS. Any knowledge of IBM internals such as AC/INT, AC/VTAM will be a distinct advantage. Normal insurance house apply.

IBM CONSULTANCY ANALYST/PROGRAMMERS

£12,000 NEG. Have you got what it takes! All you need is about 2 years' COBOL or PLI experience gained in a commercial environment. If you have any other attributes such as U21 or CICS, then obviously your salary will be higher. If you haven't, don't worry, an extensive TRAINING WILL BE GIVEN. Get out of the rat and rat, and call us now to discuss this exciting opportunity further.

INTERNATIONAL BANKING

£12,000 A major international bank has an opening for an experienced RPG II analyst/programmer to move into the demanding role of finance consultancy. Ideally, you should have a solid programming background coupled with some exposure to analytical duties, gained in a GSD environment. Banking experience is NOT ESSENTIAL as full training in banking systems will be provided. Company benefits include cheap mortgages, free lunches and personal loans.

GSD CONSULTANCY ALL LEVELS

£10-14,000 Excellent opportunities exist for analyst/programmers and project leaders within this specialist consultancy. The company develops commercial applications software for IBM S34 and S36 users and have a remarkably successful track record in the field. Good RPN or II experience is needed, coupled with solid analysis skills and team leadership for the more senior positions.

IBM CICS PROGRAMMER WEST MIDLANDS

£18,000 The client is one of the largest users of IBM Technology in the Midlands and is at present looking to add to its computer application programming staff. A qualified CICS programmer, with a minimum of 2 years' experience, is required. The successful candidate will be responsible for the development and maintenance of CICS programs with a company which is at the forefront of information technology.

MANUFACTURING ANALYST/PROGRAMMER WEST MIDLANDS

£18,000 Experience of programming with at least 3 years' experience in the field of manufacturing systems are needed to join a successful manufacturing company as their number two of the department. A knowledge of IBM TSO systems or RPG programming will be desirable, but is not essential. A thorough knowledge of manufacturing systems is most important.

DATA GENERAL ANALYST/PROGRAMMERS

£18,000 + £2 We have two clients who are seeking experienced Data General Analyst/Programmers, one in the South Midlands and one in the West Midlands. Both positions offer a very attractive salary package, excellent benefits, and a challenging environment. Both positions also carry several large benefits, such as RPA, substantial allowances, free petrol, etc.

CP/M PROGRAMMERS

£18,000 Programmers and Analysts/Programmers with several years' experience in CP/M systems are required for an up and coming software house in the East Midlands. Experience must include, but not be limited to, CP/M systems, particularly in the area of database systems, and a thorough knowledge of the CP/M operating system.

EXPERIENCED PROGRAMMER

Pretty Polly is the largest individual Ladies' Hoelery Manufacturer, the Brand Leader in the UK Hoelery market and one of the largest producers in the world. The Company's headquarters and manufacturing plant is located in Sutton-in-Ashfield, Nottinghamshire and there is a second manufacturing Company in Killarney in the Irish Republic.

Our current Computer Installation consists of an I.C.L. ME28, operating under TME and is supported by two remote ICL System 10/120e and an I.C.L. DRS 20 system.

We are looking for a fully experienced Programmer to join a small team engaged in all aspects of commercial business systems.

Ideally candidates will have several years experience of programming in COBOL and it is essential that some of this time has been spent on communications applications (preferably TME TP). A knowledge of PLAN would also be a distinct advantage.

A competitive salary, based on experience and excellent fringe benefits will apply, including a contributory Pension Scheme and Free Life Assurance.

Please write or telephone for an application form to the Personnel Department, Pretty Polly Limited, Unwin Road, Sutton-in-Ashfield, Notts NG17 4JL. Telephone: Mansfield 552500.

The real Operations Management Challenge!

OPERATIONS MANAGER and PRODUCTION CONTROL MANAGER to £20k+ car

Dun and Bradstreet are the world's leaders in the supply of information services to the business community. Business, marketing and financial information is the crucial factor to the success of commerce and industry - AND IS THE DIRECT PRODUCT OF THIS ORGANISATION'S DATA PROCESSING FUNCTION!

Dun and Bradstreet have now embarked on the creation of a new European Business Information Centre for its operations throughout the continent. Sited in Uxbridge, Middlesex, it will be one of the most advanced data processing and distribution centres in Europe with the latest offerings from IBM and CULLINET, initially 3083 hardware and MVS, CICS, IDMS and VTAM.

AN OPERATIONS MANAGER AND A PRODUCTION CONTROL MANAGER are required now to bring their relevant experience, expertise, and men-management ability to the pre-installation planning and development stage and then take full responsibility for the efficient running of their departments. They will report to the Director of Information Services.

THE OPERATIONS MANAGER

Responsible for the successful running of the technically advanced installation, which produces the company's information products and services. He end his team are, therefore, controlling the very foundation of Dun and Bradstreet Europe's operation.

THE PRODUCTION CONTROL MANAGER

Will take charge of all aspects of quality control, job scheduling/set-up and production services. Particularly important will be the setting up and maintaining of standards within Information Services, liaison with users and determination/analysis of service levels. Both will have at least five years' experience of IBM equipment and software/business practices plus

- ★ PROVEN MANAGEMENT AND INTERPERSONAL SKILLS
- ★ SELF-MOTIVATION
- ★ CONVERSANT WITH MVS ENVIRONMENT
- ★ ABILITY AND EXPERIENCE TO SET UP "GROUND FLOOR" PROJECTS

A SALARY OF UP TO £20,000 WILL BE PAID for both positions plus a car and there are other excellent company benefits.

Please contact Ivor Brookstone or Nick Marsh

A prestigious position as Head of Commercial Data-Processing

Career opportunity in Kuwait

One of the leading Companies in the Middle East with highly advanced technology requires a career minded DP professional to assume divisional responsibility for the direction and administration of all aspects of the Company's commercial data processing activities.

The Company is embarking on a strategic programme of intensive development work in the fields of database management and network technology and requires an energetic, experienced individual with a commitment to technical excellence and the maturity and personality to lead and motivate a team of 58 computer staff to assist the Company in achieving its ambitious plans for the future.

In addition to developing new commercial systems and maintaining and

enhancing existing systems, the Head of Commercial Data Processing will also supervise the physical operation of the

Superb benefits

- high tax free salary
- married/family status
- generous relocation allowances
- free air conditioned furnished accommodation
- company car
- 45 days leave
- annual return air flights
- generous educational assistance
- high tax free gratuity

installation, which consists of several ICL mainframes.

If you are a graduate, preferably in Business Administration/Computer Science with sound organisational abilities and at least 10 years experience of project management, hardware and software selection, staff supervision and installation management in the Oil or related industries, this is an ideal opportunity for you to expand your career horizons with a progressive Company, firmly committed to the new technology in a country which offers excellent sports facilities for you and your family.

The benefits are superb and will especially appeal to the family man, keen to undertake a challenging career assignment overseas.

Please telephone John Kelly on 01-836 8411 to obtain more details and an application form or send your C.V. to him at Computer People International, VLI House, 68-69 St Martin's Lane, London WC2N 4JS.

Each one of our Design & Development Engineers is an investment in our future.

Add your name to the team where your contribution will be recognised.

As the world moves rapidly into a new era of communications, STC Telecommunications are meeting the new technological challenges with all the confidence of a company accustomed to leading in its field. The Engineering Centre at Basildon is involved with the design, development and detailed engineering of equipment used in telecommunication transmission networks from initial concept through to manufacture and installation. Increased investment here is part of a major growth programme to carry our expanding organisation into tomorrow's world.

Now you can add your name to the list of Design and Development Engineers working at the leading edge of communications technology - representing our investment in the future. You can join one of our small teams working on a wide variety of projects where your professional contribution will be quickly recognised and you will enjoy an unrivalled level of sophisticated support

facilities. In fact, everything is geared for your success. Quarterly reviews ensure that your performance and achievements are recognised and your career is properly directed into areas of maximum benefit to both you and the Company. Our policy of 'technical stream promotion' complements normal seniority progression and takes full account of your individual special talents, moving you upwards into positions of greater scope and responsibility.

All of which is good news for experienced professional Electronics Engineers at various levels of seniority - including those with project management experience. We want people who are capable of creative thought, have a disciplined approach and are determined to build a successful career in Digital Signal Processing and Multiplex Design, Optical Systems and Network Management Systems.

If you've experience in any of the following areas, we'd like to meet you:

High & Low Speed Logic Design, Digital Signal Processing, Semi-Custom Design, Microprocessor Applications, Application of fast Analogue to Digital Converters, Analogue Design, Electro-optic Components, Digital Systems & Networks, Switched Mode Power Supply Design, Circuit Design translation for Drawing Office, Test Models, Project Control, CAD software, Test & Planning.

If you would like the full story on these exceptional career opportunities plus details of our generous relocation package which will enable you to enjoy living in an attractive part of Essex where there is excellent housing, social and recreational facilities, then telephone or write to: Pam Prosser, Senior Personnel Officer, STC Telecommunications Ltd., Transmission Products Division, Chester Hall Lane, Basildon, Essex SS14 3BW. Tel: Basildon (0268) 3040.

Developing tomorrow's communications technology in an environment for technical recognition.

STC Telecommunications - in Basildon

IBM OPPORTUNITIES ANALYST/PROGRAMMER ESSEX £8-10,500

Due to major expansion plans for 1984, my client, a highly respected British manufacturing company is seeking a number of analyst/programmers to join their sales and marketing development team. Two years + IBM COBOL is essential, preferably coupled with DOS/VSE and JCL, however due to the number of posts available, JCL training can be provided. Normal large company benefits and superb prospects. Ref. GW2737

IBM ASSEMBLER CITY To £12,000

Two new positions with International City Bank housing a range of IBM mainframes, GSD and DOS machines. They require a senior programmer with 4 years + experience, and a programmer with 2 years + experience of IBM Assembler, DOS/VSE and hopefully UNIPAY or financial experience. You will play an important role in their support team, with every opportunity to increase your user skills. Full banking package including subsidised mortgage. Ref. GW2737

SYSTEMS ANALYST MIDDLESEX To £13,000

International marketing/retail organisation housing IBM 4300 Kii under DOS/VSE with CICS and DL/I, is seeking 2 analysts with an IBM background, and 4 years + D.P. experience. You will be working on the investigation and development of a range of sales, marketing and manufacturing systems, and should have very strong personal communication skills. Full range of benefits including relocation assistance where necessary. Ref. GW2737

ANALYST/PROGRAMMER To £10,500

Superb opportunity for ambitious young analyst/programmer to join this import/export company. The ideal candidate will be well educated, with 2 years experience of IBM COBOL, DOS/VSE, and possibly some knowledge of CICS, DL/I or RPG II, coupled with plenty of drive and enthusiasm. Benefits include non-contributory pension, free health insurance, 5 weeks' holiday and relocation assistance. Ref. GW2737

PROGRAMMER SURREY To £9,500

12 months + commercial IBM COBOL gained in a DOS/VSE environment, are the essential requirements for this interesting development position. You will be working in an IBM 4341, DOS/VSE, VM/CMS, CICS, UFO environment, so any knowledge of these skills would be advantageous. Current projects include payroll, budgets, financial modelling and you will be joining a young dynamic team and rewarded with flexible, paid overtime, free parking and staff discounts. Ref. GW2737

PROGRAMMER/ANALYST LONDON To £10,500 Neg

One of the world's largest petroleum groups, has a need for programmer/analysts who can use their initiative and drive, within a structured team environment. 2 years + IBM MVS COBOL is essential, and you will be working in a CICS and DL/I environment with VSAM and JES 2. Plenty of opportunity to move more towards an analysts role if desired. Call for more details. Ref. GW2737

INTERNATIONAL TRAVEL To £11,500

Outstanding opportunity for a programmer/analyst to utilise his or her technical and customer liaison skills within my client's U.K. and European offices. 2 years + IBM COBOL, with MVS and DL/I is essential, together with the ability to liaise with all levels of staff, and assist in the implementation of a financial system. Strong management prospects for the right candidate. This electronics group offer a bonus scheme, health and life insurance, and relocation where appropriate. Ref. GW2314

SYSTEMS PROGRAMMERS To £14,000

We have too many positions to advertise if you can offer 18 months - 5 years systems programming experience in an IBM DOS/VSE, MVS or VM/CMS environment together with any of the following: CICS, VTAM, NCP, ACF, JCL, ASSEMBLER, JES 2, we have opportunities available in London, Essex, Herts, Berks, Surrey and Kent with excellent career prospects and benefits. Worth a call Ref. C/8 6342

IBM PL/I NORTH WEST LONDON £10,000

A large engineering concern based in North West London require an IBM PL/I programmer analyst to join a small development team. The company house an IBM 4341 running under MVS and DOS/VSE and using IDMS. Applicants with on-line experience preferred although batch programmers will strongly be considered. The company offer an excellent career path for self motivated individuals. Benefits include LV's and S.T.L. Ref. GW2674

Brushfield House, 12 Brushfield Street
Bishopsgate, London E1 6AN
Telephone: 01-247 3356 (24 Hours)

RPG II/III

IBM SYSTEM 34 LONDON c.£12,000

A Senior Analyst/Programmer is required by my clients, a major manufacturing concern. A large production control project will shortly be underway and the candidate chosen will heavily assist with the design and implementation of the system and will often deputise in the D.P. Manager's absence. The company offer excellent benefits including S.T.L. subsidised restaurant and non-contributory pension scheme. Ref. GW2739

FULL RETRAINING IBM SYSTEM 38!! N. LONDON/HERTS To £10,000

A subsidiary of a large multi-national organisation are seeking to recruit an additional programmer/analyst with either an IBM system 34/RPG II background or an IBM System 38/RPG III programmer. Full IBM courses offered to retrain from 34 to 38. You will be developing and enhancing commercial systems and databases. Initially you will be mainly programming but you will move into a more analytical role in the very near future. If you feel you fit the bill then please do not hesitate to apply. Relocation assistance offered. Ref. GW2733

IBM SYSTEM 38 WEST COUNTRY c.£12,000

Highly professional information consultancy require an IBM System 38/RPG III analyst/programmer, who is able to offer technical advice to more junior members of staff and who is able to play a leading role. The ideal candidate should have a minimum of 2 years GSD experience with at least 12 months 38/RPG III experience together with a good technical ability. The opportunity to move into management is highly likely. Full relocation assistance is offered. Ref. GW2743

IBM SYSTEM 38 RETRAIN!!! MIDDLESEX £9-11,000

One to continued company expansion, this well established and highly respected company are seeking to recruit 2 additional programmers/analysts. They have just upgraded from IBM System 34 to a System 38. Although experienced RPG III programmers would be ideal, they are quite willing to retrain good IBM system 34/RPG II people. The company are on the final stages of conversion work and thereafter will be involved with major development projects. If you can offer 18 months' GSD experience then why not give me a call to discuss these opportunities. Ref. GW2735

OTHERS

DEC/PDP - MACRO II To £10,000 + More

My Client a major financial organisation based in London is currently seeking to recruit a Programmer/Analyst with MACRO II and RSX-11-M experience. Systems Analysts/Engineers

Opportunities with Ford in Industrial Control and Automation Systems

One of the key features in Ford's emergence as clear leaders of the automotive industry is our highly automated, efficient and profitable high volume production, combined with stringent quality control. Supporting this leading edge attack on production efficiency, Ford are investing heavily in computerised Process Control and are committed to the rapid expansion of the Ford of Europe Process Control Department based at Brentwood, Essex.

Here, our team of experienced specialists are currently working on a number of real-time projects including:

- On-line tracking and scheduling of vehicles
- Engine Testing
- Testing of Automatic Gearboxes
- Programmable Controller Language Development
- Machine error-diagnostics

— Shopfloor Communications — Flexible Manufacturing Systems.

These projects are being developed on VAX, PDP11 and GA minicomputers using VMS, RSX11 and CONTROL IV Operating Systems with the applications written in PASCAL, BCPL and Assembler languages.

Our need is for men or women aged 21 to 40 with a Computer Science, Scientific, Engineering degree or equivalent, and preferably 2-3 years' experience of minicomputers in the real-time/process control field.

It will be

Opportunity in

to £13K + Bonus

Herts

Our client is a world leader in the research, development and manufacture of prescription medicines. The continuing commitment of the research and development department to computerisation has led to substantial growth of their computer resources.

Within this sophisticated multi-machine environment (including VAX, PDP11, IBM 4341 and WANG machines) a challenging opportunity has arisen for a person with communications expertise to play a leading role in the following areas.

- DECNET
- ETHERNET
- X25
- VOICE COMMUNICATIONS
- VIDEO TELECONFERENCING

This position will provide the opportunity to develop existing communications skills designing, developing, implementing and supporting internal and international communications.

A competitive salary will be paid and benefits include a discretionary bonus scheme, free BUPA and life assurance, contributory pension scheme, flexible working hours and relocation assistance where appropriate.

For further information please telephone Keith Taylor or write enclosing a full curriculum vitae to our Reading office.

ANALYST/ PROGRAMMERS

£ attractive +
generous mortgage
assistance

Victory Insurance are specialist reinsurers with over 60 years' experience in the United Kingdom and International Markets. We are a forward looking company utilising the latest IBM technology. Two additional Analysts/Programmers are needed to join a highly professional team. A solid DP background gained in an IBM installation is essential. Sound Cobol programming skills are required and experience in systems analysis work or training in a commercial environment would be beneficial.

Our modern offices are pleasantly located by the sea and in addition to an attractive salary we offer a number of benefits which include a comprehensive relocation package, generous mortgage assistance, a subsidised staff restaurant with luncheon vouchers, free life assurance, permanent health insurance and an active sports and social club.

S-COM

COMPUTER SYSTEMS ENGINEERS LTD

SOFTWARE ENGINEERS

£8-£13,000

★ A commitment to problem solving appropriate to the technology of the 80s. ★ A professional approach to client relations. ★ A career commitment to its staff. These are the cornerstones which have allowed S-COM, a highly successful software house, to preserve a favourable standing with its increasing client base embracing leading organisations within industry, commerce and government establishments. Immediate vacancies exist for **SOFTWARE ENGINEERS** with experience in ANY of the following areas:

- ★ DEC and INTEL machine architecture.
- ★ ASSEMBLERS and BLOCK STRUCTURED HIGH LEVEL LANGUAGES.
- ★ SCIENTIFIC, ENGINEERING or DEFENCE end users.
- ★ MILITARY, COMMUNICATIONS, PROCESS CONTROL or REAL TIME applications.

The majority of work is carried out at client sites and candidates should be prepared to travel to these locations where necessary. Salaries are excellent and opportunities exist for rapid career development.

NATIONAL PANASONIC PROGRAMMER/ ANALYST

£ EXCELLENT

Progress is a by-word at National Panasonic. Through this and technological development we have become successful world leaders in the field of consumer electronics. Sharing in that success is Panasonic's computer department. Our hardware, development techniques and systems match the very latest in technological advancement and all staff within the department are key personnel fulfilling important roles in a demanding environment.

An opportunity exists for a **COBOL PROGRAMMER** or **PROGRAMMER/ANALYST** with sound experience gained in an IBM environment running under DOS/VSE and ICCF or equivalent. Some knowledge of CICS and DL/I would be advantageous although use of ELIAS reduces this to minimum importance. In return for the right skills we provide a benefits package as befits a company of our stature and offer a salary substantially in excess of current earnings.

NEW MIDDLESEX-BASED COMPUTER CENTRE

IBM 3083 – MVS/JES2, TSO/SPF, CICS and IDMS

Our client is a major international organisation operating in the Financial Information Services sector of the market on a worldwide basis, and is currently setting up a new centralised European computer centre. Decisions have been taken to develop a wide range of financial services for UK and European customers which involves the design and implementation of large DATABASE systems using IDMS and CICS as a TP monitor.

Immediate requirements are to recruit a number of key D.P. Professionals which will provide them with the scope and opportunity to make a significant contribution to the development of new major batch and on-line/realtime projects. Excellent career progression will be afforded to those D.P. Professionals who can demonstrate their skills and contribute towards these ambitious development plans.

PROJECT LEADERS c.£15,000+
Applicants must be able to demonstrate a sound technical track record of design and implementation of large-scale batch and on-line database applications, with experience of IDMS or other database experience. A working knowledge of command level CICS is essential for one of the positions preferably gained in an OS/MVS/JES2 database environment. A knowledge of BAL would be an advantage, but not essential. Project Leaders are responsible for functioning systems and associated documentation.

DATABASE ANALYST c.£14,000+
This position will suit someone with a sound knowledge of IDMS (IBM or ICL), together with a working knowledge of COBOL. The successful applicant, who will be responsible to the Database Administrator, must be able to communicate effectively at Project Manager level, and make database design decisions. Additional functions would eventually include responsibilities for staff at junior level.

If you are attracted to the challenge of these ambitious development plans, which provide the scope and opportunity for excellent career progression and benefits package, call IAN C. BUICK, MBOS, Managing Director,

Network Controller

£13k-£14k · BUPA · Worcestershire.

We are the Computer Services Department of a major international company based in some Worcestershire, our prestige, purpose-built premises have been carefully planned to cater for the central computing needs of our company throughout the '80's. We provide a comprehensive on-line and rapidly growing distributed support service to all the company's sites throughout the United Kingdom.

You will be responsible for the management of an extensive Data Network which primarily serves on ICL mainframes and the provision of appropriate software. The role will encompass the control of a team which provides the day-to-day support and contact with users at all levels and ensures the smooth running of communications hardware and software in both our central and remote locations. Planning future data networks and keeping abreast of new technology is also important to this role.

You should have the experience necessary to prepare reports, proposals and demonstrations of our systems and possess the ability to cope effectively with problem situations. A solid knowledge of terminal and communications hardware/software must be supported by the acumen to communicate effectively with user management.

This is a demanding role with excellent scope for progression to more senior positions within the company.

For further information contact our Recruitment Consultants asking for Leslie Kingsford-Smith on **021 643 8501** or **021 353 4460** (eves/wknds). Alternatively simply complete and return the **FREEPOST** coupon to **Computer People Midlands, Alpha Tower, Birmingham B1 1BR.**

JOB OPPORTUNITIES IN THE MIDLANDS

Stability returns to the Midlands

Many companies are looking to the end of the recession and brighter job prospects... Jacqueline Moore reports

EXAMPLES of many of the UK's vital industries can be found throughout the Midlands. Within each principal town the car manufacturer, electrical engineer or computer maker has built its factories and offices.

In each large firm and in many smaller concerns the data processing department has become indispensable, and although the department's fortunes have varied with the fortunes of industry over the past two years of recession, most now report a newfound stability.

Car manufacturing and its associated industries have suffered visibly from the country's economic unrest, with difficult staffing management relations, increasing foreign imports and redundancies. But there is a hint of optimism.

John Creswell, operations manager for Talbot Motor Company in Coventry, says: "The situation is stabilising. The last 12-18 months have been a problem."

In a computing department at Talbot with 110 staff there are no vacancies at present, but Creswell says optimistically: "There is a possibility I may take on staff."

Those who leave for other jobs or to enter retirement, he says, will probably be replaced.

This has not been the case for some other companies in recent months. Rolls Royce Motors, in Shrewsbury, has had to make about five staff redundant in one sector where it was decided to subcontract the work out.

The company has also been unable to run its training scheme for school-leavers this year. But Tony Parsons, senior training officer for Rolls Royce, hopes the company will reinstitute the scheme next year.

"This year, we didn't put anyone on the scheme," he said, "but we'll be interviewing in February/March hopefully for staff to take on in 1984."

The outlook for graduates and trainees is brightening more rapidly than prospects for other members of staff. The Rolls Royce course in Shrewsbury enables school-leavers with A-levels to be sponsored on sandwich courses at a university or polytechnic.

"We offer five sponsorships," says Parsons, "mostly for mechanical engineering, but some go into computing later."

The courses normally last for four years, during which the students are members of staff. After this, adds Parsons, "we like to give them a permanent place."

Talbot Motor in Coventry also offers positions to graduates. Says Creswell: "We take on some graduates - about three a year. We tend to have an in-house progression policy, promoting the young people we take on."

Peter Roe, head of the computer information division at Fisons' Pharmaceutical Division in Loughborough, Leicestershire, also likes to fill vacancies with graduates. "We tend to take on grad-

uates in the development area," he says, "although recruitment has been very slow recently. We would not automatically recruit anybody at the moment."

Fisons, which has 47 computing staff in operations, technical support and systems support, also invites local students to work at the company for a set period in order to gain professional experience.

Graham Clarke, operations manager at Fisons Pharmaceutical, explains: "A number of times we've had people from local technical colleges who come on a sandwich course basis." This usually carries on for a period of one year.

"We normally have at least one person from the college," Clarke adds.

Applied Computer Techniques has been recruiting both graduates and experienced members of staff in the Midlands. There have been vacancies in all areas, including technical, sales and programming.

Job prospects for experienced staff are not all gloomy. Most companies say that they will require experienced computing staff when vacancies occur.

Terry Hughes, data processing officer for Britannic Assurance Company in Moor Green, Birmingham, which has mainly ICL systems, says he takes on a majority of people with experience. "We do look for experienced people," he says, "but we don't always find them."

Britannic has about 25 staff in

systems and programming and, says Hughes, the situation is "quite stable and will continue so."

Keith Wigley, data processing manager with Rolls Royce Motors in Shrewsbury, echoes this. "It will be some time before we're recruiting," he says, "but we'll probably need people with specific skills." The company has an IBM 4331.

At Talbot Motor, John Creswell suggests that when he tries to fill a vacancy, he cannot always find suitable recruits.

"We do look for experienced people," he says, "but we don't always find them."

Talbot has several different types of computer, including systems from Amdahl, IBM and NCR.

A spokesman for Lucas' recruitment department in Shirley, near Birmingham, says the company takes on all kinds of people, including experienced staff, graduates, people from government training schemes and non-computer candidates from other areas, who are then trained up.

Numbers of vacancies are not available, he adds, because Lucas is a decentralised company, with each division, such as Lucas Electrical or Lucas Aerospace, dealing with its own recruiting.

Recruitment is a subject in this part of the country. Several companies agree that although they are not giving details of current vacancies it could be harmful to give details of current vacancies.

"After all," said one, "I can change rather drastically. After working in a manufacturing environment for 11 years, most companies are able to take on new staff as soon as they are such action to the recruitment."

As Peter Roe of Fisons says: "We would always like to find a fresh blood."

A hint of optimism for the car manufacturing and associated industries in the Midlands.

JOB OPPORTUNITIES IN THE MIDLANDS

sandwell

Metropolitan Borough Council

An Equal Opportunity Employer

EDUCATION DEPARTMENT
(LIBRARIES AND MUSEUMS SERVICE)

COMPUTER SERVICES LIBRARIAN

Grade SO1/2 £9,060 to £10,535

Sandwell Library Service is considering the introduction of an integrated stand alone on-line computerised system for circulation control, stock ordering, acquisition and cataloguing. The postholder will be responsible for the necessary investigation of the project and implementation. It is anticipated that the appointment will initially be for a period of three years.

Applicants must have considerable experience in staff management and public library computer operations at a senior level, together with the ability to plan, organise, negotiate with suppliers and effectively manage a project of this nature.

A thorough knowledge of public library systems and developments in the new technology is required, together with the ability to work under pressure. Minimum qualification for this post is Association of the Library Association, or appropriate equivalent.

Closing date: 7th October, 1983.

Requests (quoting Ref. No. 486 and enclosing S.A.E. for application forms and further details should be made to the Personnel Officer, Town Hall, West Bromwich B70 9X. A Union Membership Agreement is in operation. Canvassing of members of the Authority will be illegal. (5460)

Manager

Information Technology Centre
PO1b - £11,364-£12,738 p.a.

The Worcester Information Technology Centre, which is sponsored by Hereford and Worcester County Council, is seeking a Manager to lead a team to organise and run this challenging new project.

The Centre will provide twelve months' training and work experience for thirty young unemployed people in electronics, microprocessing, computing and electronic office skills. In addition the Centre will develop a series of IT products and will be accessible to the local community.

The Manager will be responsible for setting up the Centre, designing and implementing an appropriate training programme, promoting the Centre's facilities, and testing and developing ideas for new products. He/she should have qualifications and experience in the information technology field, preferably at managerial level.

Further details and application forms may be obtained from the County Council of Hereford & Worcester, County Buildings, St Mary's Street, Worcester WR1 1TW. Telephone: Worcester 353366 ext. 3468. Closing date: September 23rd, 1983.

Centre for Computing and Computer Science

COMPUTER OFFICER

Applications invited from graduates with relevant academic, industrial or research experience for a post of Computer Officer within the User Services Group of the Centre. The Group is responsible for Applications Software and user guidance and in addition to these duties the appointee will have special responsibilities in the area of liaison with external services in particular with users of the recently installed Cyber 203 System at UMCC.

Salary according to age, qualifications and experience will be on the Computer Officer scale (£6,310 - £11,615) - £14,125 plus superannuation.

Further particulars from Mrs. J. E. Butler, Senate Division, The Registry, University of Birmingham, P.O. Box 363, Edgbaston, Birmingham B15 2TT, to whom applications (3 copies), including full Curriculum Vitae - naming three referees should be sent by Friday, 7th October, 1983. Please quote ref. no. CV1 (5477)

MANN'S

A regional operating company of Watney Mann and Truman
Brewers Limited requires a

DATA PROCESSING OPERATIONS MANAGER

Responsibilities will include the efficient and economical management of the department along with the provision of a comprehensive data processing service to the company using three Data General mini computers with communications links to an IBM mainframe computer.

If you have experience in this field, are educated to a high level and are aged between 25 and 45 then we would like to hear from you.

The salary and benefits are as you would associate with a major company and applications should be made to: Mr. C. C. Pollard, Mann's Northampton Brewery Company Limited, PO Box 22, Ludlow, Wey, Harlestone Road, Northampton NN5 7UL, stating relevant experience and current salary (5497)

THE UNIVERSITY OF ASTON IN BIRMINGHAM

ANALYST/PROGRAMMERS

Exciting and interesting new developments including networking, modelling and on-line systems give rise to two new posts in the Administrative Data Processing Unit. The Unit provides a full computer service in the Central Administration based on an ICL ME 29 installation and is involved with a library system to be implemented on a GEAC 8000 computer.

Successful candidates will have experience of integrated on-line systems and programming experience in COBOL. However, the appointment of a candidate with a good academic background and data experience may be considered. Salary - OTHER RELATED (A - £7,190 to £11,615 per annum.

For further details and application forms please contact Mr. A. R. Rose, University of Aston in Birmingham, School of Computing, Birmingham B4 7ET (021-359 3611 Ext. 4972) quoting reference 82/83/GW.

Closing date for applications September 26th, 1983. (5498)

UNIVERSITY OF LEICESTER Computing Studies Unit

LECTURER IN COMPUTING

Applications are invited for a post of Lecturer in Computing in the Computing Studies Unit. Applicants should have experience in some branch of non-numerical Computer Science, and have suitable postgraduate or industrial experience.

Initial salary will depend on qualifications and experience of the Lecturer. Scale £7,190 to £14,125.

Previous applicants for this post will be reconsidered and need not re-apply.

Further particulars from the Registrar, University of Leicester, University Road, Leicester, LE1 7RH, to whom applications should be sent on the form provided by October 7, 1983. (5499)

LEICESTER POLYTECHNIC A COMPUTER SYSTEMS TECHNICIAN

is required to work in the school of mathematics, computing and statistics.

The Computer Systems Technician will build, renovate and maintain laboratory hardware and provide technical assistance to students in the laboratories.

It is expected that the successful applicant will have an HNC or HND qualification. Salaries will be in the range £5840 to £8135 per annum.

Further details and application forms available from the Personnel Officer, Leicester Polytechnic, P.O. Box 143, Leicester LE1 8BH. Tel: (0533) 661561 Ext 2303. (5499)

SENIOR OPERATIONS ANALYST (COMMUNICATIONS)

£9,657-£11,136

To undertake responsibility for the Council's teleprocessing network, including equipment installation, problem resolution, reliability/performance monitoring and the establishment of job control/security and operations procedures. The work will involve considerable technical liaison with Systems Development staff and the provision of advice and guidance to users.

We operate a 4mb IBM 4341/2 with an STC 3805 using MAF software to control a network of 100 terminals. VM is the host environment for both DOS/VSE using CICS and DL1 and CMS facilities such as APL and ADRS. Applicants must have a minimum of 4 years' operations experience including at least 2 years' working on communications networks and possess a high level of technical expertise in the communications field.

If you are an Operations Analyst/Network Controller seeking responsibility, then contact Allen Chmbers, Data Services Officer on 01-303 7777 Ext 782, or write to The Data Processing Manager, D.P. Department, 8 Brampton Road, Bexleyheath, Kent DA7 4EZ. Closing date 22.9.83.

Bexley

The Centre for Computer Studies Ngee Ann Polytechnic Singapore

Director: Rodney Shaw MA BSc CEng FBSC FIMA

Two ACADEMIC STAFF are required for January 1984, to support the continuing development of the CENTRE FOR COMPUTER STUDIES which was established in September 1982 within Ngee Ann Polytechnic, Singapore. The Centre's principal function is to provide a HND in Computer Studies course with an annual intake of 200 students.

Duties and Qualifications
Candidates should be capable of lecturing at HND level and able to offer one or both of the following specialist areas:

Programming using Cobol
Systems Analysis and Design
Candidates should be academically well-qualified with appropriate professional and lecturing experience.

Terms and Conditions of Service
A generous package of salary plus allowances, including accommodation and children's schooling, will be negotiated with each successful candidate. Contracts will be initially for two or three year periods of appointment. Salaries up to £20,000 per annum are available for senior staff appointments.

Applications
Further particulars of the posts and application forms may be obtained by telephoning 01-680 6572, extension 41, or writing to Overseas Educational Appointments Department, The British Council, 90-91 Tottenham Court Road, London W1P 0DT, quoting reference AG3 132-133. The closing date for applications is 27 September 1983 with interviews taking place in London during the middle of October.

MINI & MICRO-BASED CONTROL SYSTEMS

WORCESTERSHIRE

REAL-TIME PROGRAMMERS

c£9.5K plus Relocation Assistance

Experienced programmers are required for the development of software for a variety of projects using DEC minis and various micro computers. The projects include advanced production control and materials handling systems, and systems for engineering and security applications.

We are interested in hearing from committed programmers with mini and/or micro real-time systems experience, or people with good general programming skills wishing to advance their careers. You will join an expanding DEC systems and software house with a fast developing Special Projects Group and must be able and willing to work on occasional single person projects or as members of a team.

Rewards in terms of the variety of work and the opportunity for the protection of effort, are equalled by the prospects for excellent career and salary advancement for the right people.

Applicants should write with C.V. or request for an application form to Digby Dyke, Managing Director, at the address below, or telephone him on Worcester (0905) 611512 office hours or Malvern (06845) 2210 evenings and weekends.

Computer Personnel & Executive Development Associates Ltd.
Old Bank House, Bank Street, Worcester WR1 2EW.

ANALYST PROGRAMMER

OXFORD

c.£9,500

Our clients are part of a highly successful multi-national financial care company. They require a professional ANALYST PROGRAMMER with around 18 months experience to work on the development of commercial systems using an IBM SM with RPGII and COBOL. An excellent benefits package including relocation and p.p.p. is available for the successful candidate.

SYSTEMS ANALYST

COVENTRY

c.£11,000

In return for your experience of the BASIC language, however limited, one of our clients in the Coventry area are looking for a Systems Analyst with a minimum of five years' D.P. experience in either Manufacturing or Financial Applications. Our clients are looking for someone with this applications background and who is seeking sound business analysis rather than technical systems experience. This is an up and growing company with a full order book.

ANALYST/PROGRAMMER

WEST MIDLANDS

c.£9,000

If you are an Analyst/Programmer with strong experience in a manufacturing environment then here is your opportunity to move into an IBM GSD installation. Our clients are looking for someone with this applications background and who is seeking sound business analysis rather than technical systems experience. This is an up and growing company with a full order book.

SUPPORT ANALYST

BIRMINGHAM

c.£9,000 + car

A leading OEM in the micro computer field is looking for a sales support analyst to take charge of their Midlands operation. Experience of the BASIC language is essential, and the preferred applicant will have worked for another manufacturer or dealer in a support role. Experience of the DEC range of hardware would be ideal.

ANALYST/PROGRAMMER

BIRMINGHAM

c.£9,000

One of the leading service companies in the Birmingham area are looking for an analyst/programmer to supplement their D.P. department. Strong Analysis skills are required, as well as experience of the language BASIC. The hardware used is the DEC VAX system, though experience of this particular machine is not essential as the company will train the successful applicant in the relevant software.

For any of these positions or other Midlands opportunities please call KEVIN YOUNG in BIRMINGHAM as soon as possible.

Targa Computer Recruitment

Sphinx could be the answer to the riddle of your future.

Sphinx is a rapidly growing, dynamic company marketing professional microcomputer software.

As a direct result of our success to date and in order to help us maintain our exciting programme of expansion, we wish to receive applications from suitably qualified and experienced personnel to fill the undermentioned senior positions.

UNIX specialist

This position is in the Consulting and Training Department of Sphinx. The Department is staffed by experts who provide highly specialised services in the areas of consultancy and training in the UNIX world.

Applicants should have an in-depth UNIX knowledge as well as a good understanding of the computer industry in general. You must also be articulate and a good communicator.

The position provides opportunity for some overseas travel.

Software Sales

(reporting to Software Sales Manager).

The job demands that you sell Sphinx software products and services to Dealers and End Users.

Areas of responsibility will be clearly defined but within these you will be expected to show professional selling skills, initiative and enthusiasm.

Proven sales experience and an understanding of the software systems market are essential.

Pre-sales Software Support

(reporting to Software Sales Manager).

The position requires you to support the sales team in selling software products to Dealers and End Users. It means, therefore, that the successful applicant will occupy an important position as a positive interface between the product technical staff and the commercial sales force.

An understanding of UNIX is essential and DEC experience would be an added advantage.

The structure of the company will allow career development in the direction of sales, consultancy or training.

Business Software Support

Applicants should have a knowledge of business languages such as COBOL, DIBOL and BASIC.

You will be part of a small team who specify, evaluate, document and support software under the UNIX operating system.

Experience with business applications under a multi-user operating system is essential.

Sphinx offers excellent career development prospects and the remuneration packages, plus car where appropriate, reflect the importance of the positions.

Interested applicants should submit their CV to:

Mrs. H. Smith,
Sphinx Limited, 43-83 Moorbridge Road,
Maidenhead, Berks, SL6 8PL.
Tel (0628) 78343.

LET YOUR HIGH TECHNOLOGY CAREER GROW IN THE GARDEN OF ENGLAND

SALES PEOPLE - 20K Plus

Micro Technology are looking for intelligent, articulate individuals with a proven record of success in the sale of micro computer-based systems. As authorised dealers for the IBM PC we need your help to make the most of the opportunities available in this pleasant part of England. The reward for hard and successful work includes a package of 20K plus, a company car, private medical insurance and four weeks' annual holiday. We offer a unique opportunity to sell first class systems from the world's best known computer manufacturer to a large and responsive market.

We are also looking for:

HARDWARE ENGINEERS - To 10K

To install and maintain mainly IBM-PC and Z80-based systems. Training will be given on specific hardware. Knowledge of micro-based systems and electronic/electrical qualifications are essential for these positions.

PROGRAMMER - 7 to 12K

To develop and install a micro-based software distribution system. The successful applicant will be familiar with 8080/Z80 and CP/M. Knowledge of 8086/8088 and MS-DOS/PC-DOS would be useful but not essential. Proven ability would be considered as being more important than formal qualifications for this position.

SOFTWARE CONSULTANTS - To 12K

To support our successful sales team in researching, demonstrating and installing the latest in software available on the micro systems we sell. Knowledge of micro applications packages and the MS-DOS or CP/M operating systems will be a distinct advantage. A degree in computer or business related studies would be useful for this position.

If you are interested in joining a successful young company and growing with us, please write to us, or alternatively phone David Owens on 061 45433.

MICRO TECHNOLOGY LTD., 51 THE PANTILES
TUNBRIDGE WELLS, KENT

IBM AUTHORISED DEALERS FOR THE IBM PERSONAL COMPUTER

Senior Systems Analyst

for a challenging new DP operation

There can be few more interesting tasks than to be involved in the setting up of a completely new DP operation. And when that operation is within a fast growing, highly progressive Company, then the prospects are all the more exciting.

Océ is a well established, successful Company and part of a Dutch based international group. Our range of top quality plain paper copiers has put us amongst the leaders in this highly competitive market. Now in order to increase still further our operational efficiency, we are setting up a fully integrated computer system covering all aspects of the Company's business especially in Sales, Marketing, Finance and Administration.

The successful candidate will be responsible for carrying out a detailed analysis of systems requirements and also be involved in establishing the Company's DP function. As a senior member of the development team you will work in close conjunction with the

Systems Manager and will be responsible for project leading and installation of various systems.

The position calls for five years DP experience of which at least two years must be in systems analysis.

Coupled with this must be the ability to work within a team as well as on your own initiative. A background in O & M would be an advantage.

A salary in the region of £12,500 will be offered together with an excellent benefits package and the opportunity to build a career with a fast growing organisation.

Please send a detailed CV or telephone for an application form to the Personnel Manager, Océ Copiers (UK) Limited, Langston Road, Loughton, Essex. Telephone: 01-502 1851.

Community
Development*

Location; to the North of London: Large IBM environment

Our client is a major IBM user. Their International Data Centre Headquarters is based to the North of London. Because of changes they now wish to fill the following vacancies.

Systems Programmer (Salary c. £14,000 p.a.)

We are looking for someone with at least 2 years' systems programming experience who during that time will have worked in an MVS/SP environment. The position is particularly attractive as it offers not only the opportunity to support software and hardware in the United Kingdom but also internationally, and will certainly involve some overseas travel. Successful applicants will probably be graduates who will be committed to working in the Systems Programming area.

User Support Specialists (Salary c. £12,000 p.a.)

These are particularly interesting positions. The successful applicants will have a good knowledge of programming and IBM software and will play the role of the "Systems Engineer" resolving user reported software problems, advising users on how to best utilize current software. At the same time they will ensure that users are aware of new products within this important area.

APL Specialist (Salary c. £12,000 p.a.)

We are looking for someone with a good knowledge of APL and perhaps TSO over a period of 2 to 3 years. The position will attract someone who has worked within the computer service industry or a large user. Personality and communication skills are very important as there will be considerable contact with users at all levels.

Capacity Planner (Salary c. £14,000 p.a.)

The company has installed the latest CMF package and experience of forecasting user computer demand would be a considerable asset. A broad knowledge of IBM hardware and software is obviously essential PLUS the ability to use modelling tools and inquiry facilities such as APL, EASYTRIEVE and SAS. However, it is also important to have the ability to work on one's own, generating confidence with users, whilst maintaining a high degree of inventiveness and initiative. The position will involve some European travel.

Our client offers an excellent range of benefits and where necessary there will be relocation assistance.

To apply, please telephone Jane Jones today or write to her at: A&A Consultants (Holding) Ltd., County House, 10 Little Portland Street, London W1. Tel: 01-631 4184.

SIX OF THE BEST

*Advertisement
Project
Development*

An opportunity exists within a well established and successful, internationally capable and expanding programming resource, to recruit a number of individuals. The successful applicant will lead a team of eight programmers and there are also further opportunities currently involved in the development of major new systems. These include: solid IBM COBOL programming, as well as previous experience of supervising other programming staff. This is a key position and successful prospects are essential for the right person.

*Advertisement
Systems Analyst*

Our client is an international organization offering a world-wide information service. As part of a programme of expansion and development, they are seeking an individual who can demonstrate several years experience of major development projects, preferably on both large mainframe and on mini-computers. The successful applicant will be expected to assume responsibility for one or more systems, should be highly motivated and capable of dealing with stress and management at all levels. A career path into senior management is envisaged.

*Advertisement
VME Support
Salary circa £12K*

South of the river and the parkland of London lies an organisation looking for you. You've been buried in the backroom supporting VME and your knowledge of COBOL (and hopefully PL/I) is going to waste. Get involved in the latest ICL software tools and expand your skills into communications as a support programmer within this dynamic and progressive organisation.

Systems Programmer in Hertfordshire £10K + negotiable

We are a major insurance organisation with an expanding DP Department, looking for a young, enthusiastic systems programmer to join a team involved with the development of computer systems. You should have four years' DP experience, two of which should have been in Systems Programming based on IBM mainframe ideally 4300. Knowledge of two of the following is essential: VM, OS/VS1 and CICS. A background of COBOL or Assembler would be desirable. The company are planning to migrate to MVS and DL1 within the next two years and a knowledge of this would be considered favourably. There are generous fringe benefits.

DEC/Programmers to £11K London

Would you like to work for the most successful consultancy in the world? Just two years' basic + two programming experience on DEC 11/70/34 will interest this company. They need confident, capable people who are technically sound and want to develop their career rapidly. Abilities in areas of client liaison and support are essential as you will be based on clients' premises for the greater part of these major development projects.

Probably the most challenging installation in Hampshire Salary Circa £11½K

We are talking about commitment, two way commitment. An international financial service group offers totally committed professional COBOL Analyst Programmers a golden opportunity to produce the goods within their dramatic expansion programme. A minimum of three years' IBM COBOL experience is essential in addition to knowledge of structured techniques. Don't worry if you live in the Midlands or the North. If you are the right person for the job our client will pay relocation in full in addition to a whole package of generous fringe benefits.

MANAGEMENT &
EXECUTIVE SELECTION

Manchester

The National Computing Centre has wide responsibilities for the promotion of effective computing in the United Kingdom. To meet the challenge and change of the future we have created a new post of Software Engineering Manager.

We are seeking an innovative real-time software engineering specialist to lead the Centre's investigations into forward looking developments and its contribution to national initiatives in this sphere. The task will be to determine the parameters of the work to be undertaken, to create the team, to liaise with other organisations in the field and, subsequently, to ensure results are made widely available and utilised within the UK computing community.

The successful candidate, male or female, is likely to be in the 30-40 age group, of high intellectual calibre with a record of successful involvement in Software Engineering.

Salary: Initially, within a range up to £19,000.

Conditions of service are excellent.

Please write as soon as possible with your career details indicating why you believe you have the technology, the leadership and personal skills to make a significant contribution to our post, to:

The Personnel Manager,
THE NATIONAL COMPUTING CENTRE LTD.,
Oxford Road, Manchester M1 7ED.

MANAGEMENT OPPORTUNITY WITH TOP BRITISH MICRO MANUFACTURER

MICROCOMPUTER MARKETING MARKETING MANAGER-INDIRECT SALES £17K to £20K + BENEFITS PACKAGE, OXFORD-BASED

A key factor in Research Machines' success is its product policy which focuses on the concept of microcomputer networks and is backed by company-wide commitment to product quality, performance, and reliability. The high level of sales achieved throughout the educational sector by our 4802 system is a conspicuous example of this.

The next phase of our marketing plan is to bring the 4802 to a wider audience via indirect sales - primarily through dealers, but also through OEMs and systems houses. This represents a significant and challenging marketing strategy for a company which has previously concentrated on direct sales to end users.

We are now looking for a Marketing Manager to develop and implement this important step forward.

The successful candidate will be resourceful, imaginative, and motivated, with considerable negotiating and analytical skills, and should have:

- 1. a degree
- 2. experience in, and excitement about, the microcomputer industry.

Experience of working with dealers at a management level.
You will probably be a professional marketer, with a comprehensive understanding of the relationship between marketing and the selling, support, promotion and training functions. We would not, however, rule out applicants with the right level of sales or technical experience who could demonstrate a strong understanding.

The potential for the 4802 (and for our next generation of systems now under development) and the challenge of this 'green fields' opening make this a key appointment which will provide an opportunity second to none for the right applicant. Salary is unlikely to be an obstacle and we offer a particularly attractive benefits package including car, 25 days holiday, free BUPA life and disability insurance, pension scheme, and generous help with relocation expenses.

If you are interested in this vacancy please contact Polly Kerwin on Oxford (0865) 726136 or write for an application form, quoting reference: MMIS/CW9.

PROFESSIONAL PROGRAMMERS

Our company is owned by computer professionals dedicated to maintaining the highest standards in Data Processing. We are currently trying to find other people like us to fill permanent, and contract, positions with our clients in the North-West.

Our most urgent requirements are for experienced programmers, analyst/programmers and software engineers to work on D.E.C. and I.C.L. equipment.

The D.E.C. clients are seeking skills in Assembler, BASIC, BASIC+ or COBOL. The I.C.L. clients require COBOL with VME experience and, ideally, IDMS and TP.

For an initial discussion, please telephone Liz Segal, 061-928 2227 (Days), 061-928 5495 (Evenings and weekends) or, send her your C.V. to: Interoffice House, Old Market Place, Altrincham WA14 4DL

U.S.A.

Analyst/Programmers to \$35K+ Bonus

Exciting permanent career opportunities currently exist with a major U.S. bank who are at the forefront of banking systems technology. Current developments include real-time international fund transfer systems on the latest IBM hardware and software configurations.

Our client has successfully recruited over 200 UK computer professionals into the USA over the last four years. They are therefore well qualified to advise on every conceivable aspect and make all necessary arrangements to ensure that the move to the U.S.A. is completed smoothly.

Graduates with more than 18 months IBM COBOL should have at least one of the following:

- CICS
- IMS DB/DC
- DBL

These are genuine opportunities for fast career advancement on the most up-to-date techniques in an exciting and dynamic environment. Real management opportunities exist and continual in-depth training ensures a high level of skill and awareness is maintained. Fringe benefits include a generous bonus scheme and full relocation assistance for single or family status.

For further information please telephone Keith Taylor on (0784) 595346 (24 hour answering service) or write enclosing a full C.V. to our Reading office.

DISABLED LIVING FOUNDATION Analyst/Programmer

An exciting and prestigious post in a national information service on disability.
Applications are invited for a new post with the Disabled Living Foundation's Information Service for one year with possibility of extension.
The duties of the post will be concerned with the development of a computer-based PDP 11/23 information and on-line retrieval system where knowledge of database development and on-line retrieval system will be used to the maximum. A secondary task will be to extend the use of the system in administration of the Foundation's work. The project is funded from the Department of Industry.
Salary: £9,000-£10,000.
Application form and further information from: The Disabled Living Foundation, 246 Kensington High Street, W8 5NS. Telephone: 01-622 2481.

METROPOLITAN BOROUGH OF TRAFFORD BOROUGH TREASURER'S DEPARTMENT

COMPUTER PROJECT LEADER PO1 (6-10) £11,364-£12,738 p.a.

The Council is seeking a person to join its highly experienced and dedicated CP team of staff.
The installation is a 15 megabyte IBM 3083E with 17.5 gigabytes of on-line storage. Conversion of the operating system from DOS/VSE to MVS is currently in progress. The present climate of development is stimulating and challenging; the network comprises 120 local and remote terminals and development work on all aspects of IT is underway.
Major facilities and languages include CICS, TSO, RACF, UDF and COBOL. Extensive use is made of program development aids covering both batch and on-line systems for all departments of the Council. Users are encouraged to develop their own reports.
Applicants should be efficient analyst/programmers able to work without supervision to a clearly defined strategy; experience of the above languages will be an added advantage. The successful applicant will have a keen interest in systems design and user consultancy. He/she will also be able to motivate staff and, above all, have a dedicated and wholehearted commitment to the success of the installation.
Application form from Miss S. Dawson, Borough Treasurer's Department, P.O. Box 10, Werburk House, Washway Road, Sale, Manchester, M33 1AT. Telephone 061-569 6101 Extension 2112. Closing date 21st September, 1983. (1325)

COMPUTER OPERATIONS SUPERVISOR/OPERATOR

ES.870-47.404

Applications are invited for the post of Supervisor/Operator in the new United Kingdom-wide computer development for the nursing profession.

The post is located in refurbished premises in central Edinburgh. The National Board for Nursing, Midwifery and Health Visiting for Scotland will operate an on-line computer database, shared with three other National Boards and a Central Council, using an IBM mainframe computer. The post requires equipment expertise with computers, terminals and telecommunications and knowledge of data handling and control. Local equipment comprises micro-computers, providing batch and on-line I/O facilities.

Further particulars and application forms, to be returned by 22nd September 1983, are available from Mr Peter Taylor, National Board for Nursing, Midwifery and Health Visiting for Scotland, 22 Queen Street, Edinburgh EH2 1JX. (1323)

Programmers: Help us to produce the world's best car.

As part of our commitment to produce our cars even more efficiently with the same dedication to superb standards of excellence, we are continuing the development and maintenance of our own D.P. systems.

Development areas include engineering, materials management and production, as well as financial and marketing applications.
These projects utilise the facilities of an IBM 4341 Model 11 with VM DOS/VSE operating system. All our new developments use IDMS database with ADS on-line. Main programming language is PL/I using command level CICS.

The following three posts have now arisen at our Crewe production site:

Post 1 Up to £10,000

With a background in IDMS, but specifically with experience of ADS, you'll be involved almost exclusively in our new developments. Experience of PL/I and/or CICS would be preferable.
Please quote ref: Com 1.

Posts 2 & 3 Up to £9,000

Involved in development work, you'll have 2-3 years' experience of PL/I and/or CICS. Ideally you will also have experience of IDMS or Assembler.
Please quote ref: Com 2.

Career prospects are good and the salaries offered depend on experience. Company benefits include 33 days' holiday, a 4%

day working week, a preferential car purchase scheme, pension and sick pay schemes, sports and social clubs and a subsidised canteen. A comprehensive relocation package is offered, where appropriate.

We are pleasantly located on the outskirts of Crewe, convenient for travel from Stoke or Manchester.
Please telephone or write quoting appropriate reference, to:-

Mr. D. Roberts,
Personnel Department,
Rolls Royce Motors Limited,
Crewe CW1 3PL.
Tel: Crewe (0270) 235133
extension 3311.

(16203)

University of London: The London School of Economics

Join the new SSRC Centre in Economic Computing

The SSRC Centre in Economic Computing now established in the London School of Economics and Political Science wishes to appoint four technical members of staff. These are:

1. Economist/Analyst
2. Database Specialist
3. Systems Analyst
4. Programmer

This is a major new initiative to provide computing support to economists in the academic community, industry and commerce. The Centre is funded initially by the Social Science Research Council with the aim of its becoming self-financing after approximately five years.

An excellent opportunity is offered to appropriate applicants to play an important part in establishing the new Centre and to influence the future development of Economic Computing. There will be a healthy balance in the development of Economic Computing. There will be a healthy balance in the development of Economic Computing. There will be a healthy balance in the development of Economic Computing.

The Economist/Analyst will be appointed on a scale parallel to London: £13,516 to £16,926 a year whilst other appointments will be on a scale parallel to University Lecturers: £7,190 to £14,125 a year. London Allowance of £1,186 is payable in addition on each of these scales.

Method of Application: Application forms and further particulars are available, on receipt of a stamped addressed envelope, from the Assistant Secretary (Academic), HEB, The London School of Economics, Houghton Street, London WC2A 2AE.

Closing date for applications: 10th October, 1983.

(16204)

UNIVERSITY OF NEWCASTLE UPON TYNE

Transport Operations Research Group

Two Posts of Research Associate: SERC Special Initiative in INFORMATION TECHNOLOGY IN TRANSPORT

Applications are invited for two posts of Research Associate to assist in the development of a special initiative in information technology in transport.

Project A is designed to explore, in consultation with GEC Traffic Automation Ltd., the technical feasibility of developing an automatic vehicle identification system for the roads for heavy lorries and of applying this technology to an overall road pricing system for public movement in a large conurbation. With the cooperation of the GLC, London will be used as a case study.

Project B will be conducted with the cooperation of London Transport and will evaluate the real-time data matrix displays which have been installed at a number of underground stations. The impact of the system on passengers' perceptions of waiting time and on route choice will be assessed in order to explore the prospects for more widespread use of such systems.

Applicants should have a relevant higher degree and, particularly for Project B, appropriate industrial or research experience.

Salary will be according to age and experience on the London 1A scale, £7,190 to £11,615 per annum, with a maximum of £10,976 per annum for Project A and £7,668 per annum for Project B.

Further particulars of the posts can be obtained from U. T. Slick, Division of Transport Engineering, Department of Civil Engineering, The University, Newcastle upon Tyne NE1 7RU, to whom applications should be sent by 4th October 1983, enclosing three references and enclosing a curriculum vitae. Applicants should state interest in post A or post B.

(16205)

LONDON SCHOOL OF ECONOMICS COMPUTER SERVICE

RSTS Support Programmer

The School has several PDP 11 computers which are used for a variety of word processing and administrative tasks, and applications are invited from experienced programmers to become a member of the team supporting the computer and developing applications in areas such as statistical information retrieval and student records.

Candidates will complete Supporting RSTS at the system level, including troubleshooting, system organisation, writing operating procedures, handling upgrades and installations, monitoring the Work-It package at the computer level, together with some user contact, arranging the transfer of data between the RSTS machines and a variety of other computers, from micro to mainframe, writing application programs in BASIC PLUS, COBOL and CUPID to agreed specifications; designing and using databases; information retrieval systems.

Applicants will be expected to have a good degree in a computer-based discipline, and preferably at least two years' experience. Salary, according to age and experience, will be in the range £7,400-£11,100.

Applicants must submit a curriculum vitae, by September 20, 1983, signed by a referee, to the Personnel Officer, London School of Economics, 90 Tottenham Court Road, London W1P 0LP, telephone 01-583 1200.

Applicants must submit a curriculum vitae, by September 20, 1983, signed by a referee, to the Personnel Officer, London School of Economics, 90 Tottenham Court Road, London W1P 0LP, telephone 01-583 1200.

Lancashire County Council

An Equal Opportunity Employer

COUNTY TREASURER'S DEPARTMENT

SENIOR SYSTEMS PROGRAMMER (MICRO)

Salary within the Current Range SD11/P01 (1-7) - £9,000-£11,000

This is a new post and is one of three senior systems programmer posts within the Systems Support Section, which is headed by a Principal Systems Programmer. There are also senior programmer and system analyst posts. The duties will involve working closely with the Principal Systems Programmer and other senior members of staff in the identification and implementation of modern technology to the benefit of the County Council. The Authority has a wide range of equipment including terminals, word processors and a strategy to link this equipment is being developed.

The computer installation, which will shortly be enhanced, presently consists of an ICL 2916 with 8 mb static core, console, local and exchangeable disc storage and communications facilities providing an ILE, MAC and TP service operating on VME(B). This machine also provides extensive facilities for District Councils and a Development Corporation.

The location is in Preston which has excellent road and rail links as well as being only one hour's drive from the Lake District, other areas of scenic and recreational interest. There is a highly secure environment for the safeguarding of information resources. Applicants should have more than ten years of practical experience in software support of modern technology and equipment and be able to communicate with technical staff at all levels. Application forms are available from the County Treasurer, PO Box 100, County Hall, Preston, or by telephoning Anne Smith on Preston 263776.

Closing date: Friday, 30th September, 1983.

UNIVERSITY OF EDINBURGH Edinburgh Regional Computing Centre SENIOR COMPUTING OFFICER COMMUNICATIONS SOFTWARE

A graduate with several years' experience in software design and implementation, with a particularly strong background in dealing with hardware, is required to work on the development of the University Data Network. The Network currently comprises a large X25 network based on 3 GEC packet switches and a Cambridge Ring with over a thousand terminals and 14 hosts. Most of the development will be in the next three years, but longer, be concentrated on the integration of an Ethernet into the Network which is due to be installed in the next few months.

The appointment will be a permanent post on the Senior Computing Office Scale of £10,710 to £14,125 plus superannuation.

For application or further particulars please apply to the Administration Officer, ERCC, James Clerk Maxwell Building, Maxwell Road, Edinburgh EH8 3JZ or telephone 01-557 1081 Extension 222.

MARCH COMPUTER RECRUITMENT

Project Leader - Global Data Network

based Hong Kong

c.£20K p.a. tax paid

+ substantial fringe benefits

The Hongkong Bank Group, as well as being one of the world's leading financial organisations, is an industry leader in EDI applications and EFT networks.

Due to the expansion of its corporate and consumer banking services, a Project Leader is required to join the Technical Services Division in the Head Office in Hong Kong.

You will have responsibility for the development and implementation of a packet switched network and the interface to terminal systems in the Group's offices throughout the world. This will entail extensive travel as the project progresses.

It is most unlikely that candidates less than 30 will have the experience of international communication systems and the disciplines of computer system development that are essential for this position.

Conditions of service are excellent. In addition to the tax paid salary indicated, the post carries attractive benefits including free fully furnished accommodation, a housing loan in your home country, six weeks' annual leave with free air travel, children's education allowance and holiday passages.

Please ring or write for an application form by Monday, 26th September 1983, to: A.M. Child, International Recruitment Controller, The Hongkong Bank Group, 99 Bishopsgate, London EC2P 2LA.

Tel: 01-638 2366, ext. 2923.
